INHIBITORS OF INTERLEUKIN-1 $\beta$  CONVERTING ENZYMETECHNICAL FIELD OF THE INVENTION

The present invention relates to novel  
5 classes of compounds which are inhibitors of  
interleukin-1 $\beta$  converting enzyme ("ICE"). The ICE  
inhibitors of this invention are characterized by  
specific structural and physicochemical features. This  
invention also relates to pharmaceutical compositions  
10 comprising these compounds. The compounds and  
pharmaceutical compositions of this invention are  
particularly well suited for inhibiting ICE activity  
and consequently, may be advantageously used as agents  
against interleukin-1 ("IL-1") mediated diseases,  
15 including inflammatory diseases, autoimmune diseases  
and neurodegenerative diseases. This invention also  
relates to methods for inhibiting ICE activity and  
methods for treating interleukin-1 mediated diseases  
using the compounds and compositions of this invention.

20 BACKGROUND OF THE INVENTION

Interleukin 1 ("IL-1") is a major pro-  
inflammatory and immunoregulatory protein that  
stimulates fibroblast differentiation and  
proliferation, the production of prostaglandins,  
25 collagenase and phospholipase by synovial cells and  
chondrocytes, basophil and eosinophil degranulation and

- 2 -

neutrophil activation. Oppenheim, J.H. et al, Immunology Today, 7, pp. 45-56 (1986). As such, it is involved in the pathogenesis of chronic and acute inflammatory and autoimmune diseases. IL-1 is

5 predominantly produced by peripheral blood monocytes as part of the inflammatory response and exists in two distinct agonist forms, IL-1 $\alpha$  and IL-1 $\beta$ . Mosely, B.S. et al., Proc. Nat. Acad. Sci., 84, pp. 4572-4576 (1987); Lonnemann, G. et al., Eur.J. Immunol., 19,

10 pp. 1531-1536 (1989).

IL-1 $\beta$  is synthesized as a biologically inactive precursor, pIL-1 $\beta$ . pIL-1 $\beta$  lacks a conventional leader sequence and is not processed by a signal peptidase. March, C.J., Nature, 315,

15 pp. 641-647 (1985). Instead, pIL-1 $\beta$  is cleaved by interleukin-1 $\beta$  converting enzyme ("ICE") between Asp-116 and Ala-117 to produce the biologically active C-terminal fragment found in human serum and synovial fluid. Sleath, P.R., et al., J. Biol. Chem., 265,

20 pp. 14526-14528 (1992); A.D. Howard et al., J. Immunol., 147, pp. 2964-2969 (1991). Processing by ICE is also necessary for the transport of mature IL-1 $\beta$  through the cell membrane.

ICE is a cysteine protease localized

25 primarily in monocytes. It converts precursor IL-1 $\beta$  to the mature form. Black, R.A. et al., FEBS Lett., 247, pp. 386-390 (1989); Kostura, M.J. et al., Proc. Natl. Acad. Sci. USA, 86, pp. 5227-5231 (1989). ICE, or its homologues, also appears to be involved in the

30 regulation of cell death or apoptosis. Yuan, J. et al., Cell, 75, pp. 641-652 (1993); Miura, M. et al., Cell, 75, pp. 653-660 (1993); Nett-Fiordalisi, M.A. et al., J. Cell Biochem., 17B, p. 117 (1993). In particular, ICE or ICE homologues are thought to be

35 associated with the regulation of apoptosis in

- 3 -

neurogenerative diseases, such as Alzheimer's and Parkinson's disease. Marx, J. and M. Baringa, Science, 259, pp. 760-762 (1993); Gagliardini, V. et al., Science, 263, pp. 826-828 (1994).

5 ICE has been previously described as a heterodimer composed of two subunits, p20 and p10 (20kDa and 10kDa molecular weight, respectively). These subunits are derived from a 45kDa proenzyme (p45) by way of a p30 form, through an activation mechanism  
10 that is autocatalytic. Thornberry, N.A. et al., Nature, 356, pp. 768-774 (1992). The ICE proenzyme has been divided into several functional domains: a prodomain (p14), a p22/20 subunit, a polypeptide linker and a p10 subunit. Thornberry et al., supra; Casano  
15 et al., Genomics, 20, pp. 474-481 (1994).

Full length p45 has been characterized by its cDNA and amino acid sequences. PCT patent applications WO 91/15577 and WO 94/00154. The p20 and p10 cDNA and amino acid sequences are also known. Thornberry  
20 et al., supra. Murine and rat ICE have also been sequenced and cloned. They have high amino acid and nucleic acid sequence homology to human ICE. Miller, D.K. et al., Ann. N.Y. Acad. Sci., 696, pp. 133-148 (1993); Molineaux, S.M. et al., Proc. Nat. Acad. Sci.,  
25 90, pp. 1809-1813 (1993). Knowledge of the primary structure of ICE, however, does not allow prediction of its tertiary structure. Nor does it afford an understanding of the structural, conformational and chemical interactions of ICE and its substrate pIL-1 $\beta$   
30 or other substrates or inhibitors.

ICE inhibitors represent a class of compounds useful for the control of inflammation or apoptosis or both. Peptide and peptidyl inhibitors of ICE have been described. PCT patent applications WO 91/15577; WO  
35 93/05071; WO 93/09135; WO 93/14777 and WO 93/16710; and

- 4 -

European patent application 0 547 699. However, due to their peptidic nature, such inhibitors are typically characterized by undesirable pharmacologic properties, such as poor oral absorption, poor stability and rapid metabolism. Plattner, J.J. and D.W. Norbeck, in Drug Discovery Technologies, C.R. Clark and W.H. Moos, Eds. (Ellis Horwood, Chichester, England, 1990), pp. 92-126. This has hampered their development into effective drugs.

Accordingly, the need exists for compounds that can effectively inhibit the action of ICE, for use as agents for preventing and treating chronic and acute forms of IL-1 mediated diseases, including various cancers, as well as inflammatory, autoimmune or neurodegenerative diseases.

#### SUMMARY OF THE INVENTION

The present invention provides novel classes of compounds, and pharmaceutically acceptable derivatives thereof, that are useful as inhibitors of ICE. These compounds can be used alone or in combination with other therapeutic or prophylactic agents, such as antibiotics, immunomodulators or other anti-inflammatory agents, for the treatment or prophylaxis of diseases mediated by IL-1. According to a preferred embodiment, the compounds of this invention are capable of binding to the active site of ICE and inhibiting the activity of that enzyme.

It is a principal object of this invention to provide novel classes of inhibitors of ICE. These novel classes of ICE inhibitors are characterized by the following structural and physicochemical features:

a) a first and a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom

- 5 -

of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

5                   b) a first and a second moderately hydrophobic moiety, said moieties each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2  
10 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

                  c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent  
15 atoms in the moiety and said moiety being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

It is also an object of this invention to provide a method for identification, design or  
20 prediction of ICE inhibitors comprising the steps of:

                  a) selecting a candidate compound of defined chemical structure comprising at least two hydrogen bonding moieties, at least two moderately hydrophobic moieties and one electronegative moiety  
25 comprising one or more electronegative atoms attached either to the same atom or to adjacent atoms in the electronegative moiety;

                  b) determining a low-energy conformation for binding of said compound to the active site of ICE;

30                   c) evaluating the capability of said compound in said conformation to form at least two hydrogen bonds with the non-carbon backbone atoms of Arg-341 and Ser-339 of ICE;

                  d) evaluating the capability of said  
35 compound in said conformation to associate with at

- 6 -

least two of the binding pockets of ICE selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket;

5 e) evaluating the capability of said compound in said conformation to interact with the P1 binding pocket of ICE; and

f) accepting or rejecting said candidate compound as an ICE inhibitor based on the  
10 determinations and evaluations carried out in the preceding steps.

It is a further object of this invention to provide novel classes of ICE inhibitors represented by formulas:

Definitions

25           The following terms are employed herein:

          The term "active site" refers to any or all of the following sites in ICE: the substrate binding site, the site where an inhibitor binds and the site where the cleavage of substrate occurs. The active  
30 site is characterized by at least amino acid residues: 173, 176, 177, 178, 179, 180, 236, 237, 238, 239, 244, 248, 283, 284, 285, 290, 338, 339, 340, 341, 342, 343,

- 8 -

344, 345, 348, 352, 381, 383, using the sequence and numbering according to Thornberry et al., supra.

5 The terms "P binding pocket", "S subsite", "S pocket", and the like, refer to binding subsites, or portions of the substrate binding site on the ICE molecule. The amino acid residues of the substrate are given designations according to their position relative to the scissile bond, i.e. the bond which is broken by the protease. The residues are designated P1, P2, 10 etc., for those extending toward the N-terminus of the substrate and P1', P2', etc., for those extending toward the C-terminus of the substrate. The portions of an inhibitor which correspond to the P or P' residues of the substrate are also labeled P1, P1', 15 etc., by analogy with the substrate. The binding subsites of the ICE molecule which receive the residues labeled P1, P1', etc., are designated S1, S1', etc., or may alternately be designated "the P1 binding pocket", "the P1' binding pocket", etc. [I. Schechter and A. 20 Berger, "On the Size of the Active Site in Proteases", Biochem. Biophys. Res. Commun., vol. 27, pp. 157-162 (1967).]

25 The terms "P2 binding pocket" or "S2 subsite" of the ICE active site are equivalent and are defined as the space surrounded by amino acid residues Pro-290, Val-338 or Trp-340.

30 The terms "P3 binding pocket" or "S3 subsite" of the ICE active site are equivalent and are defined as the space surrounded by amino acid residues Pro-177, Arg-178, Thr-180, Arg-341 or Pro-343.

The terms "P4 binding pocket" or "S4 subsite" of the ICE active site are equivalent and are defined as the space surrounded by amino acid residues His-342, Met-345, Val-348, Arg-352, Asp-381, Arg-383 or Trp-340.

- 9 -

The terms "P1 binding pocket" or "S1 subsite" of the ICE active site are equivalent and are defined as the space surrounded by amino acid residues Arg-179, His-237, Gln-283, or Arg-341.

5           The terms "P' binding pocket" or "S' subsite" of the ICE active site are equivalent and are defined as the space surrounded by amino acid residues Phe-173, Ile-176, His-237, Gly-238, Ile-239, Cys-244 or His-248.

10           The term "hydrophobic" refers to a moiety which tends not to dissolve in water and is fat-soluble. Hydrophobic moieties include, but are not limited to, hydrocarbons, such as alkanes, alkenes, alkynes, cycloalkanes, cycloalkenes, cycloalkynes and aromatic compounds, such as aryls, certain saturated  
15           and unsaturated heterocycles and moieties that are substantially similar to the side chains of hydrophobic natural and unnatural  $\alpha$ -amino acids, including valine, leucine, isoleucine, methionine, phenylalanine,  $\alpha$ -amino isobutyric acid, alloisoleucine, tyrosine, and  
20           tryptophan.

          The term "moderately hydrophobic" refers to a hydrophobic moiety in which one or two carbon atoms have been replaced with more polar atoms, such as oxygen or nitrogen.

25           The term "heterocycle" or "heterocyclic" refers to a stable mono- or polycyclic compound which may optionally contain one or two double bonds or may optionally contain one or more aromatic rings. Each heterocycle consists of carbon atoms and from one to  
30           four heteroatoms independently selected from a group including nitrogen, oxygen, and sulfur. As used herein, the terms "nitrogen heteroatoms" and "sulphur heteroatoms" include any oxidized form of nitrogen or sulfur and the quaternized form of any basic nitrogen.  
35           Heterocycles defined above include, for example,

- 10 -

pyrimidinyl, tetrahydroquinolyl,  
tetrahydroisoquinolyl, purinyl, pyrimidyl,  
indolinyl, benzimidazolyl, imidazolyl, imidazolinoyl,  
imidazolidinyl, quinolyl, isoquinolyl, indolyl,  
5 pyridyl, pyrrolyl, pyrrolinyl, pyrazolyl, pyrazinyl,  
quinoxolyl, piperidinyl, morpholinyl, thiamorpholinyl,  
furyl, thienyl, triazolyl, thiazolyl,  $\beta$ -carbolinyl,  
tetrazolyl, thiazolidinyl, benzofuranoyl,  
thiamorpholinyl sulfone, benzoxazolyl, oxopiperidinyl,  
10 oxopyrroldinyl, oxoazepinyl, azepinyl, isoxazolyl,  
tetrahydropyranyl, tetrahydrofuranyl, thiadiazolyl,  
benzodioxolyl, benzothienyl, tetrahydrothiophenyl and  
sulfolanyl. Further heterocycles are described in A.R.  
Katritzky and C.W. Rees, eds., Comprehensive  
15 Heterocyclic Chemistry: The Structure, Reactions,  
Synthesis and Use of Heterocyclic Compounds, Vol. 1-8,  
Pergamon Press, NY (1984).

The term "cycloalkyl" refers to a mono- or  
polycyclic group which contains 3 to 15 carbons and may  
20 optionally contain one or two double bonds. Examples  
include cyclohexyl, adamantyl and norbornyl.

The term "aryl" refers to a mono- or  
polycyclic group which contains 6, 10, 12, or 14  
carbons in which at least one ring is aromatic.  
25 Examples include phenyl, naphthyl and biphenyl.

The term "heteroaromatic" refers to a mono-  
or polycyclic group which contains 1 to 15 carbon atoms  
and from 1 to 4 heteroatoms, each of which is selected  
independently from a group including sulphur, nitrogen  
30 and oxygen, and which additionally contains from 1 to 3  
five or six membered rings, at least one of which is  
aromatic.

The term "alpha-amino acid" ( $\alpha$ -amino acid)  
refers to both the naturally occurring amino acids and  
35 other "non-protein"  $\alpha$ -amino acids commonly utilized by

- 11 -

those in the peptide chemistry arts when preparing synthetic analogues of naturally occurring peptides, including D and L forms. The naturally occurring amino acids are glycine, alanine, valine, leucine, iso-

5 leucine, serine, methionine, threonine, phenylalanine, tyrosine, tryptophan, cysteine, proline, histidine, aspartic acid, asparagine, glutamic acid, glutamine,  $\gamma$ -carboxyglutamic acid, arginine, ornithine and lysine. Examples of "non-protein" alpha-amino acids include

10 hydroxylysine, homoserine, homotyrosine, homophenylalanine, citrulline, kynurenine, 4-amino-phenylalanine, 3-(2-naphthyl)-alanine, 3-(1-naphthyl)-alanine, methionine sulfone, t-butyl-alanine, t-butylglycine, 4-hydroxyphenylglycine, aminoalanine,

15 phenylglycine, vinylalanine, propargyl-glycine, 1,2,4-triazolo-3-alanine, 4,4,4-trifluoro-threonine, thyronine, 6-hydroxytryptophan, 5-hydro-xytryptophan, 3-hydroxykynurenine, 3-aminotyrosine, trifluoromethyl-alanine, 2-thienylalanine, (2-(4-pyridyl)ethyl)-

20 cysteine, 3,4-dimethoxy-phenylalanine, 3-(2-thiazolyl)-alanine, ibotenic acid, 1-amino-1-cyclopentane-carboxylic acid, 1-amino-1-cyclohexanecarboxylic acid, quisqualic acid, 3-trifluoromethylphenylalanine, 4-trifluoro-methylphenylalanine, cyclohexylalanine,

25 cyclo-hexylglycine, thiohistidine, 3-methoxytyrosine, elastatinal, norleucine, norvaline, alloisoleucine, homoarginine, thioproline, dehydroproline, hydroxy-proline, isonipectotic acid, homoproline, cyclohexyl-glycine,  $\alpha$ -amino-n-butyric acid, cyclohexylalanine,

30 aminophenylbutyric acid, phenylalanines substituted at the ortho, meta, or para position of the phenyl moiety with one or two of the following: a (C<sub>1</sub>-C<sub>4</sub>) alkyl, a (C<sub>1</sub>-C<sub>4</sub>) alkoxy, halogen or nitro groups or substituted with a methylenedioxy group;  $\beta$ -2- and 3-thienyl-

35 alanine,  $\beta$ -2- and 3-furanylalanine,  $\beta$ -2-, 3- and

- 12 -

4-pyridylalanine,  $\beta$ -(benzothienyl-2- and 3-yl)alanine,  $\beta$ -(1- and 2-naphthyl)alanine, O-alkylated derivatives of serine, threonine or tyrosine, S-alkylated cysteine, S-alkylated homocysteine, O-sulfate, O-phosphate and O-carboxylate esters of tyrosine, 3-sulfo-tyrosine, 3-carboxy-tyrosine, 3-phospho-tyrosine, 4-methane sulfonic acid ester of tyrosine, 4-methane phosphonic acid ester of tyrosine, 3,5-diiodotyrosine, 3-nitro-tyrosine,  $\epsilon$ -alkyl lysine, and delta-alkyl ornithine.

Any of these  $\alpha$ -amino acids may be substituted with a methyl group at the alpha position, a halogen at any aromatic residue on the  $\alpha$ -amino side chain, or an appropriate protective group at the O, N, or S atoms of the side chain residues. Appropriate protective groups are disclosed in "Protective Groups In Organic Synthesis," T.W. Greene and P.G.M. Wuts, J. Wiley & Sons, NY, NY, 1991.

The term " $\alpha$ -amino acid side chain residue" refers to a chemical moiety which is attached to the  $\alpha$ -carbon of an alpha-amino acid.

The term "bioisosteric replacement for  $-\text{CO}_2\text{H}$ " refers to group which may substitute for a carboxylic acid group in bioactive molecules. Examples of such groups are disclosed in Christopher A. Lipinski, "Bioisosteres in Drug Design" Annual Reports In Medical Chemistry, 21, pp. 286-88 (1986), and in C.W. Thornber, "Isosterism and Molecular Modification in Drug Design" Chemical Society Reviews, pp. 563-580 (1979).

The term "association" is used in reference to a condition of proximity between an inhibitor or portions thereof to an ICE molecule or portions thereof wherein the juxtaposition is energetically favored by electrostatic or van der Waals interactions.

The term "hydrogen bond" refers to a favorable interaction that occurs whenever a suitable

- 13 -

donor atom, X, bearing a proton, H, and a suitable acceptor atom, Y, have a separation of between 2.5Å and 3.5Å and where the angle X-H - - - Y is greater than 90 degrees. Suitable donor and acceptor atoms are well understood in medicinal chemistry (G.C. Pimentel and A.L. McClellan, The Hydrogen Bond, Freeman, San Francisco, 1960; R. Taylor and O. Kennard, "Hydrogen Bond Geometry in Organic Crystals", Accounts of Chemical Research, 17, pp. 320-326 (1984)).

10           The term "salt bridge" refers to the non-covalent attractive interaction between a positively charged moiety (P) and a negatively charged moiety (N) when the distance between the centers of mass of P and N is between 2 and 6 Angstroms. In calculating the center of mass, atoms which may contain a formal charge and atoms immediately adjacent to these are included. For example, a salt bridge may be formed between the positively charged guanidinium side chain of an arginine residue and the negative charged carboxylate side chain of a glutamate residue. Salt bridges are well understood in medicinal chemistry (L. Stryer, Biochemistry, Freeman, San Francisco, (1975); K.A. Dill, "Dominant Forces in Protein Folding", Biochemistry, 29, No. 31, pp. 7133-7155, (1990)).

25           The term "center of mass" refers to a point in three-dimensional space which represents a weighted average position of the masses that make up an object.

          The terms "backbone chain" and "backbone" refer to the portion of a polypeptide which comprises the repeating unit -CO-CH-NH-.

30           The term "scaffold" refers to a structural building block which forms the basis of an ICE inhibitor according to this invention. Various moieties and functional groups are intended to be appended to the scaffold. The scaffolds of this

- 14 -

invention are thus depicted having open valences.  
Various scaffolds of ICE inhibitors according to this  
invention include the portions:

5

or

10

15 In those scaffolds, the NH and CO or SO<sub>2</sub> moieties  
represent a first and a second hydrogen bonding moiety,  
said moieties each being capable of forming a hydrogen  
bond with a backbone atom of ICE, said backbone atom  
being selected from the group consisting of the  
20 carbonyl oxygen of Arg-341, the amide -NH- of Arg-341,  
the carbonyl oxygen of Ser-339 and the amide -NH- of  
Ser-339.

The term "substitute" refers to the  
replacement of a hydrogen atom in a compound with a  
25 substituent group. In the present invention, those  
hydrogen atoms which form a part of a hydrogen bonding  
moiety which is capable of forming a hydrogen bond with  
the carbonyl oxygen of Arg-341 of ICE or the carbonyl  
oxygen of Ser-339 of ICE are excluded from  
30 substitution. These excluded hydrogen atoms include  
those which comprise an -NH- group which is alpha to a  
Z or a -CO- group and are depicted as -NH- rather than  
an X group or some other designation in the following  
diagrams: (a) through (t), (v) through (y), and (I)  
35 through (VIID).

- 15 -

The term "straight chain" refers to a contiguous unbranching string of covalently bound members, i.e. atoms, which form a portion of a ring. The straight chain and the ring of which it forms a part may be substituted, but these substituents are not a part of the straight chain.

The term " $K_i$ " refers to a numerical measure of the effectiveness of a compound in inhibiting the activity of a target enzyme such as ICE. Lower values of  $K_i$  reflect higher effectiveness. The  $K_i$  value is a derived by fitting experimentally determined rate data to standard enzyme kinetic equations (see I. H. Segel, Enzyme Kinetics, Wiley-Interscience, 1975).

The term "minimize" refers to the systematic altering of the atomic geometry of a molecule or molecular complex so that any further minor perturbation of the atomic geometry would cause the total energy of the system as measured by a molecular mechanics force-field to increase. Minimization and molecular mechanics force-fields are well understood in computational chemistry [U. Burkert and N.L. Allinger, Molecular Mechanics, ACS Monograph 177, American Chemical Society, Washington, D.C. 1982 pages 59-78].

The term "strain energy" is used in this application to refer to the difference between the free conformation energy of a compound and the bound conformation energy of that compound when bound to ICE. The strain energy can be determined by the following steps: Evaluate the energy of the molecule when it has the conformation necessary for binding to ICE. Then minimize and reevaluate the energy -- this is the free conformation energy. The strain energy for binding of a potential inhibitor to ICE is the difference between the free conformation energy and the bound conformation energy. In a preferred embodiment, the strain energy

- 16 -

of an inhibitor of the present invention is less than about 10 kcal/mol.

The term "patient" as used in this application refers to any mammal, especially humans.

5           The term "pharmaceutically effective amount" refers to an amount effective in treating or ameliorating an IL-1 mediated disease in a patient. The term "prophylactically effective amount" refers to an amount effective in preventing or substantially  
10           lessening IL-1 mediated disease in a patient.

          The term "pharmaceutically acceptable carrier or adjuvant" refers to a non-toxic carrier or adjuvant that may be administered to a patient, together with a compound of this invention, and which does not destroy  
15           the pharmacological activity thereof.

          The term "pharmaceutically acceptable derivative" means any pharmaceutically acceptable salt, ester, or salt of such ester, of a compound of this invention or any other compound which, upon  
20           administration to a recipient, is capable of providing (directly or indirectly) a compound of this invention or an anti-ICE active metabolite or residue thereof.

          Pharmaceutically acceptable salts of the compounds of this invention include, for example, those  
25           derived from pharmaceutically acceptable inorganic and organic acids and bases. Examples of suitable acids include hydrochloric, hydrobromic, sulfuric, nitric, perchloric, fumaric, maleic, phosphoric, glycolic, lactic, salicylic, succinic, toluene-p-sulfonic,  
30           tartaric, acetic, citric, methanesulfonic, formic, benzoic, malonic, naphthalene-2-sulfonic and benzenesulfonic acids. Other acids, such as oxalic, while not in themselves pharmaceutically acceptable, may be employed in the preparation of salts useful as  
35           intermediates in obtaining the compounds of the

- 17 -

invention and their pharmaceutically acceptable acid addition salts. Salts derived from appropriate bases include alkali metal (e.g., sodium), alkaline earth metal (e.g., magnesium), ammonium and N-(C<sub>1-4</sub> alkyl)<sub>4</sub><sup>+</sup> salts.

5 This invention also envisions the "quaternization" of any basic nitrogen-containing groups of the compounds disclosed herein. The basic nitrogen can be quaternized with any agents known to  
10 those of ordinary skill in the art including, for example, lower alkyl halides, such as methyl, ethyl, propyl and butyl chloride, bromides and iodides; dialkyl sulfates including dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as decyl,  
15 lauryl, myristyl and stearyl chlorides, bromides and iodides; and aralkyl halides including benzyl and phenethyl bromides. Water or oil-soluble or dispersible products may be obtained by such quaternization.

20 The ICE inhibitors of this invention may contain one or more "asymmetric" carbon atoms and thus may occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. All such isomeric forms of these  
25 compounds are expressly included in the present invention. Each stereogenic carbon may be of the R or S configuration. Although specific compounds and scaffolds exemplified in this application may be depicted in a particular stereochemical configuration,  
30 compounds and scaffolds having either the opposite stereochemistry at any given chiral center or mixtures thereof are also envisioned.

The ICE inhibitors of this invention may comprise ring structures which may optionally be  
35 substituted at carbon, nitrogen or other atoms by

- 18 -

various substituents. Such ring structures may be singly or multiply substituted. Preferably, the ring structures contain between 0 and 3 substituents. When multiply substituted, each substituent may be picked  
5 independently of any other substituent as long as the combination of substituents results in the formation of a stable compound.

Combinations of substituents and variables envisioned by this invention are only those that result  
10 in the formation of stable compounds. The term "stable", as used herein, refers to compounds which possess stability sufficient to allow manufacture and administration to a mammal by methods known in the art. Typically, such compounds are stable at a temperature  
15 of 40°C or less, in the absence of moisture or other chemically reactive conditions, for at least a week.

#### DETAILED DESCRIPTION OF THE INVENTION

In order that the invention herein described may be more fully understood, the following detailed  
20 description is set forth.

We have discovered that compounds possessing the following novel combination of features are surprisingly effective ICE inhibitors:

a) a first and a second hydrogen bonding  
25 moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339  
30 and the amide -NH- group of Ser-339;

b) a first and a second moderately hydrophobic moiety, said moieties each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket

- 19 -

being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

5 c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

10 Preferably, any moderately hydrophobic moiety associating with the P2 binding pocket of ICE does so in such a way that:

a) the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 7.1Å and about 12.5Å;

b) the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the amide nitrogen of Arg-341 of ICE is between about 6.0Å and about 12Å; and

c) the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 3.7Å and about 9.5Å.

25 Preferably, any moderately hydrophobic moiety associating with the P3 binding pocket of ICE does so in such a way that:

a) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 3.9Å and about 9.5Å;

b) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the amide nitrogen of Arg-341 of ICE is between about 5.4Å and about 11Å; and

- 20 -

c) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 7.0Å and about 13Å.

5 Preferably, any moderately hydrophobic moiety associating with the P4 binding pocket of ICE does so in such a way that:

a) the distance from the center of mass of the moderately hydrophobic moiety in the P4 binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 4.5Å and about 7.5Å;

b) the distance from the center of mass of the moderately hydrophobic moiety in the P4 binding pocket to the amide nitrogen of Arg-341 of ICE is between about 5.5Å and about 8.5Å; and

c) the distance from the center of mass of the moderately hydrophobic moiety in the P4 binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 8Å and about 11Å.

20 Preferably, any moderately hydrophobic moiety associating with the P' binding pocket of ICE does so in such a way that:

a) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 11Å and about 16Å;

b) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the amide nitrogen of Arg-341 of ICE is between about 10Å and about 15Å; and

c) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 8Å and about 12Å.

More preferably, all of the above associative conditions are met in the compounds of this invention.

The practitioner skilled in the art will appreciate that there are a number of means to design the inhibitors of the present invention. These same means may be used to select a candidate compound for screening as an ICE inhibitor. This design or selection may begin with selection of the various moieties which fill binding pockets.

There are a number of ways to select moieties to fill individual binding pockets. These include visual inspection of a physical model or computer model of the active site and manual docking of models of selected moieties into various binding pockets. Modeling software that is well known and available in the art may be used. These include QUANTA [Molecular Simulations, Inc., Burlington, MA, 1992], SYBYL [Molecular Modeling Software, Tripos Associates, Inc., St. Louis, MO, 1992], AMBER [S.J. Weiner, P.A. Kollman, D.A. Case, U.C. Singh, C. Ghio, G. Alagona, and P. Weiner, J. Am. Chem. Soc., vol. 106, pp. 765-784 (1984)], or CHARMM [B.R. Brooks, R.E. Bruccoleri, B.D. Olafson, D.J. States, S Swaminathan, and M. Karplus, J. Comp. Chem. vol. 4, pp. 187-217 (1983)]. This modelling step may be followed by energy minimization with standard molecular mechanics forcefields such as CHARMM and AMBER. In addition, there are a number of more specialized computer programs to assist in the process of selecting the binding moieties of this invention. These include:

1. GRID (Goodford, P.J. A Computational Procedure for Determining Energetically Favorable Binding Sites on Biologically Important Macromolecules. J. Med. Chem., 28, pp. 849-857 (1985)). GRID is available from Oxford University, Oxford, UK.

2. MCSS (Miranker, A.; Karplus, M. Functionality Maps of Binding Sites: A Multiple Copy Simultaneous Search Method. Proteins: Structure, Function and Genetics, 11, pp. 29-34 (1991)). MCSS is available from Molecular Simulations, Burlington, MA.
3. AUTODOCK (Goodsell, D.S.; Olsen, A.J. Automated Docking of Substrates to Proteins by Simulated Annealing. PROTEINS: Structure, Function and Genetics, 8, pp. 195-202 (1990)). AUTODOCK is available from the Scripps Research Institute, La Jolla, CA.
4. DOCK (Kuntz, I.D.; Blaney, J.M.; Oatley, S.J.; Langridge, R.; Ferrin, T.E. A Geometric Approach to Macromolecule-Ligand Interactions. J. Mol. Biol., 161, pp. 269-288 (1982)). DOCK is available from the University of California, San Francisco, CA.
- Once suitable binding moieties have been selected, they can be assembled into a single inhibitor. This assembly may be accomplished by connecting the various moieties to a central scaffold. The assembly process may, for example, be done by visual inspection followed by manual model building, again using software such as Quanta or Sybyl. A number of other programs may also be used to help select ways to connect the various moieties. These include:
1. CAVEAT (Bartlett, P.A.; Shea, G.T.; Telfer, S.J.; Waterman, S. CAVEAT: A Program to Facilitate the Structure-Derived Design of Biologically Active Molecules. In "Molecular Recognition in Chemical and Biological Problems," Special Pub., Royal Chem. Soc., 78, pp. 182-196 (1989)). CAVEAT is available from the University of California, Berkeley, CA.
2. 3D Database systems such as MACCS-3D (MDL Information Systems, San Leandro, CA). This area has been recently reviewed by Martin (Martin, Y.C. 3D Database Searching in Drug Design. J. Med. Chem., 35, pp. 2145-2154 (1992)).

- 23 -

3. HOOK (available from Molecular Simulations, Burlington, MA).

In addition to the above computer assisted modeling of inhibitor compounds, the inhibitors of this invention may be constructed "de novo" using either an empty active site or optionally including some portions of a known inhibitor. Such methods are well known in the art. They include, for example:

1. LUDI (Bohm, H.J. The Computer Program LUDI: A New Method for the De Novo Design of Enzyme Inhibitors. J. Comp. Aid. Molec. Design., 6, 61-78 (1992)). LUDI is available from Biosym Technologies, San Diego, CA.

2. LEGEND (Nishibata, Y., Itai, A., Tetrahedron, 47, 8985 (1991)). LEGEND is available from Molecular Simulations, Burlington, MA.

3. LeapFrog (available from Tripos associates, St. Louis, MO).

A number of techniques commonly used for modeling drugs may be employed (For a review, see: Cohen, N.C.; Blaney, J.M.; Humblet, C.; Gund, P.; Barry, D.C., "Molecular Modeling Software and Methods for Medicinal Chemistry", J. Med. Chem., 33, pp. 883-894 (1990)). There are likewise a number of examples in the chemical literature of techniques that can be applied to specific drug design projects. For a review, see: Navia, M.A. and Murcko, M.A., "The Use of Structural Information in Drug Design", Current Opinions in Structural Biology, 2, pp. 202-210 (1992). Some examples of these specific applications include: Baldwin, J.J. et al., "Thienothiopyran-2-sulfonamides: Novel Topically Active Carbonic Anhydrase Inhibitors for the Treatment of Glaucoma", J. Med. Chem., 32, pp. 2510-2513 (1989); Appelt, K. et al., "Design of Enzyme Inhibitors Using Iterative Protein Crystallographic Analysis", J. Med. Chem., 34, pp. 1925-1934 (1991); and

5           Using the novel combination of steps of the present invention, the skilled artisan can advantageously avoid time consuming and expensive experimentation to determine enzymatic inhibition activity of particular compounds. The method also is  
10   useful to facilitate rational design of ICE inhibitors and therapeutic and prophylactic agents against IL-1-mediated diseases. Accordingly, the present invention relates to such inhibitors.

          A variety of conventional techniques may be  
15   used to carry out each of the above evaluations as well as the evaluations necessary in screening a candidate compound for ICE inhibiting activity. Generally, these techniques involve determining the location and binding proximity of a given moiety, the occupied space of a  
20   bound inhibitor, the deformation energy of binding of a given compound and electrostatic interaction energies. Examples of conventional techniques useful in the above evaluations include: quantum mechanics, molecular mechanics, molecular dynamics, Monte Carlo sampling,  
25   systematic searches and distance geometry methods (G.R. Marshall, Ann. Ref. Pharmacol. Toxicol., 27, p. 193 (1987)). Specific computer software has been developed for use in carrying out these methods. Examples of programs designed for such uses include: Gaussian 92,  
30   revision E.2 (M.J. Frisch, Gaussian, Inc., Pittsburgh, PA ©1993); AMBER, version 4.0 (P.A. Kollman, University of California at San Francisco, ©1993); QUANTA/CHARMM [Molecular Simulations, Inc., Burlington, MA ©1992]; and Insight II/Discover (Biosym Technologies Inc., San  
35   Diego, CA ©1992). These programs may be implemented,

- 25 -

for instance, using a Silicon Graphics Indigo 2 workstation or IBM RISC/6000 workstation model 550. Other hardware systems and software packages will be known and of evident applicability to those skilled in the art.

Different classes of active ICE inhibitors, according to this invention, may interact in similar ways with the various binding pockets of the ICE active site. The spatial arrangement of these important groups is often referred to as a pharmacophore. The concept of the pharmacophore has been well described in the literature (D. Mayer, C.B. Naylor, I. Motoc, and G.R. Marshall, J. Comp. Aided Molec. Design vol. 1, pp. 3-16 (1987); A. Hopfinger and B.J. Burke, in Concepts and Applications of Molecular Similarity, M.A. Johnson and G.M. Maggiora, ed., Wiley (1990)).

Different classes of ICE inhibitors of this invention may also use different scaffolds or core structures, but all of these cores will allow the necessary moieties to be placed in the active site such that the specific interactions necessary for binding may be obtained. These compounds are best defined in terms of their ability to match the pharmacophore, i.e., their structural identity relative to the shape and properties of the active site of ICE.

The ICE inhibitors of one embodiment of this invention comprise a first and a second hydrogen bonding moiety, a first and a second moderately hydrophobic moiety, and an electronegative moiety which comprise or are covalently bound to one of the following scaffolds:

15 The compounds of this invention having a  
molecular weight of less than or equal to about 700  
Daltons, and more preferably between about 400 and 600  
Daltons, are preferred. These preferred compounds may  
be readily absorbed by the bloodstream of patients upon  
oral administration. This oral availability makes such  
20 compounds excellent agents for orally-administered  
treatment and prevention regimens against IL-1 mediated  
diseases.

The ICE inhibitors of this invention may be  
synthesized using conventional techniques.  
25 Advantageously, these compounds are conveniently  
synthesized from readily available starting materials.

The compounds of this invention are among the  
most readily synthesized ICE inhibitors known.  
Previously described ICE inhibitors often contain four  
30 or more chiral centers and numerous peptide linkages.  
The relative ease with which the compounds of this  
invention can be synthesized represents an enormous  
advantage in the large scale production of these

- 110 -

compounds.

It should be understood that the compounds of this invention may exist in various equilibrium forms, depending on conditions including choice of solvent, pH, and others known to the practitioner skilled in the art. All such forms of these compounds are expressly included in the present invention. In particular, many of the compounds of this invention, especially those which contain aldehyde or ketone groups in R<sub>3</sub> and carboxylic acid groups in T, may take hemi-ketal (or hemi-acetal) or hydrated forms, as depicted below:

(EQ1)

Depending on the choice of solvent and other conditions known to the practitioner skilled in the art, compounds of this invention may also take acyloxy ketal, acyloxy acetal, ketal or acetal form:

(EQ2)

In addition, it should be understood that the equilibrium forms of the compounds of this invention may include tautomeric forms. All such forms of these

- 111 -

compounds are expressly included in the present invention.

It should be understood that the compounds of this invention may be modified by appropriate functionalities to enhance selective biological properties. Such modifications are known in the art and include those which increase biological penetration into a given biological system (e.g., blood, lymphatic system, central nervous system), increase oral availability, increase solubility to allow administration by injection, alter metabolism and alter rate of excretion. In addition, the compounds may be altered to pro-drug form such that the desired compound is created in the body of the patient as the result of the action of metabolic or other biochemical processes on the pro-drug. Some examples of pro-drug forms include ketal, acetal, oxime, and hydrazone forms of compounds which contain ketone or aldehyde groups, especially where they occur in the R<sub>3</sub> group of the compounds of this invention.

The compounds of this invention are excellent ligands for ICE. Accordingly, these compounds are capable of targeting and inhibiting events in IL-1 mediated diseases, such as the conversion of precursor IL-1 $\beta$  to mature IL-1 $\beta$  and, thus, the ultimate activity of that protein in inflammatory diseases, autoimmune diseases and neurodegenerative diseases. For example, the compounds of this invention inhibit the conversion of precursor IL-1 $\beta$  to mature IL-1 $\beta$  by inhibiting ICE. Because ICE is essential for the production of mature IL-1, inhibition of that enzyme effectively blocks initiation of IL-1 mediated physiological effects and symptoms, such as inflammation, by inhibiting the production of mature IL-1. Thus, by inhibiting IL-1 $\beta$  precursor activity, the compounds of this invention

- 112 -

effectively function as IL-1 inhibitors.

The compounds of this invention may be employed in a conventional manner for the treatment of diseases which are mediated by IL-1. Such methods of treatment, their dosage levels and requirements may be selected by those of ordinary skill in the art from available methods and techniques. For example, a compound of this invention may be combined with a pharmaceutically acceptable adjuvant for administration to a patient suffering from an IL-1 mediated disease in a pharmaceutically acceptable manner and in an amount effective to lessen the severity of that disease.

Alternatively, the compounds of this invention may be used in compositions and methods for treating or protecting individuals against IL-1 mediated diseases over extended periods of time. The compounds may be employed in such compositions either alone or together with other compounds of this invention in a manner consistent with the conventional utilization of ICE inhibitors in pharmaceutical compositions. For example, a compound of this invention may be combined with pharmaceutically acceptable adjuvants conventionally employed in vaccines and administered in prophylactically effective amounts to protect individuals over an extended period time against IL-1 mediated diseases.

The compounds of this invention may also be co-administered with other ICE inhibitors to increase the effect of therapy or prophylaxis against various IL-1-mediated diseases.

In addition, the compounds of this invention may be used in combination either conventional anti-inflammatory agents or with matrix metalloprotease inhibitors, lipoxxygenase inhibitors and antagonists of cytokines other than IL-1 $\beta$ .

- 113 -

The compounds of this invention can also be administered in combination with immunomodulators (e.g., bropirimine, anti-human alpha interferon antibody, IL-2, GM-CSF, methionine enkephalin, 5 interferon alpha, diethyldithiocarbamate, tumor necrosis factor, naltrexone and rEPO) or with prostaglandins, to prevent or combat IL-1-mediated disease symptoms such as inflammation.

When the compounds of this invention are 10 administered in combination therapies with other agents, they may be administered sequentially or concurrently to the patient. Alternatively, pharmaceutical or prophylactic compositions according to this invention may be comprised of a combination of 15 an ICE inhibitor of this invention and another therapeutic or prophylactic agent.

Pharmaceutical compositions of this invention comprise any of the compounds of the present invention, and pharmaceutically acceptable salts thereof, with any 20 pharmaceutically acceptable carrier, adjuvant or vehicle. Pharmaceutically acceptable carriers, adjuvants and vehicles that may be used in the pharmaceutical compositions of this invention include, but are not limited to, ion exchangers, alumina, 25 aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine 30 sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, 35 waxes, polyethylen -polyoxypropylene-block polymers,

- 114 -

polyethylene glycol and wool fat.

The pharmaceutical compositions of this invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. We prefer oral administration. The pharmaceutical compositions of this invention may contain any conventional non-toxic pharmaceutically-acceptable carriers, adjuvants or vehicles. The term parenteral as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

The pharmaceutical compositions may be in the form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions

- 115 -

or suspensions may also contain a long-chain alcohol diluent or dispersant such as Ph. Hely or a similar alcohol.

5                   The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, and aqueous suspensions and solutions. In the case of tablets for oral use,  
10                   carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous  
15                   suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added.

                  The pharmaceutical compositions of this  
20                   invention may also be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing a compound of this invention with a suitable non-irritating excipient which is solid at room temperature but liquid at the  
25                   rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

                  Topical administration of the pharmaceutical  
30                   compositions of this invention is especially useful when the desired treatment involves areas or organs readily accessible by topical application. For application topically to the skin, the pharmaceutical composition should be formulated with a suitable  
35                   ointment containing the active components suspended r

- 116 -

dissolved in a carrier. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petroleum, white petroleum, propylene glycol, polyoxy-  
5 ethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical composition can be formulated with a suitable lotion or cream containing the active compound suspended or dissolved in a carrier. Suitable carriers include, but are not  
10 limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water. The pharmaceutical compositions of this invention may also be topically applied to the lower intestinal tract by  
15 rectal suppository formulation or in a suitable enema formulation. Topically-transdermal patches are also included in this invention.

The pharmaceutical compositions of this invention may be administered by nasal aerosol or  
20 inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance  
25 bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

The IL-1 mediated diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, inflammatory diseases,  
30 autoimmune diseases and neurodegenerative diseases.

Inflammatory diseases which may be treated or prevented include, for example, septic shock, septicemia, and adult respiratory distress syndrome. Target autoimmune diseases include, for example,  
35 rheumatoid, arthritis, systemic lupus erythematosus,

- 117 -

scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, insulin-dependent diabetes mellitus, autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, chronic active hepatitis, myasthenia gravis and multiple sclerosis. And target neurodegenerative diseases include, for example, amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, and primary lateral sclerosis. The ICE inhibitors of this invention may also be used to promote wound healing. And the ICE inhibitors of this invention may be used to treat infectious diseases.

Although this invention focuses on the use of the compounds disclosed herein for preventing and treating IL-1-mediated diseases, the compounds of this invention can also be used as inhibitory agents for other cysteine proteases.

The compounds of this invention are also useful as commercial reagents which effectively bind to ICE or other cysteine proteases. As commercial reagents, the compounds of this invention, and their derivatives, may be used to block proteolysis of a target peptide or may be derivatized to bind to a stable resin as a tethered substrate for affinity chromatography applications. These and other uses which characterize commercial cysteine protease inhibitors will be evident to those of ordinary skill in the art.

In order that this invention be more fully understood, the following examples are set forth. These examples are for the purpose of illustration only and are not to be construed as limiting the scope of the invention in any way.

- 118 -

Example 1

The following example demonstrates a process of drug design which embodies the present invention:

5 Step 1) Pick 2 hydrogen bonding moieties of ICE, here, the backbone C=O and N-H of Arg-341.

10 Step 2) Pick a scaffold, here, a pyridone derivative, and confirm that the hydrogen bonding moieties of the scaffold are capable of forming satisfactory hydrogen bonds with the hydrogen bonding moieties selected in step 1. This confirmation is performed by using molecular mechanics techniques to minimize the scaffold fragment in the context of the active site of ICE.

(Z1)

15 Step 3) Pick a hydrophobic pocket, here, S2, as next target and a hydrophobic moiety, here, benzene. Minimize the benzene group within the S2 pocket to assure that substantial hydrophobic overlap is obtained.

(Z2)

20 Step 4) Pick another hydrophobic pocket, here, S4, as the next target and a hydrophobic moiety,

- 119 -

here, benzene. Minimize the benzene group within the S4 pocket to ensure that substantial hydrophobic overlap is obtained.

5 Step 5) Fill the S1 polar pocket with an electronegative moiety, here, a carboxylate sidechain provided by aspartic acid in which the C-terminus has been reduced to an aldehyde. Minimize to ensure that the carboxylate sidechain  
10 retains a favorable electrostatic interaction with the S1 polar pocket.

15 Step 6) Link the scaffold with the moieties from steps 3, 4, and 5, preferably using the minimum number of bonds consistent with a chemically reasonable structure. Minimize the entire composite molecule in the active site of ICE.

- 120 -

Step 7) Evaluate the energy of the molecule when it has the conformation necessary for binding to ICE. Then minimize and reevaluate the energy -- this is the free conformation energy. The strain energy for binding of the potential inhibitor to ICE is the difference between the free conformation energy and the bound conformation energy. The strain energy should be less than about 10 kcal/mol. In this case the bound conformation energy is -1.6 kcal/mol and the free conformation energy is -11.7 kcal/mol, for a strain energy of 10.1 kcal/mol.

Step 8) The inhibitor designed using the above steps has been made and has been show to have a  $K_i$  of 150 nM.

#### Example 2

We obtained inhibition constants ( $K_i$ ) and  $IC_{50}$  values for several compounds of this invention using the three methods described below:

##### 20 1. Enzyme assay with UV-visible substrate

This assay is run using an Succinyl-Tyr-Val-Ala-Asp-pNitroanilide substrate. Synthesis of analogous substrates is described by L. A. Reiter (Int. J. Peptide Protein Res. 43, 87-96 (1994)). The assay mixture contains:

25 65  $\mu$ l buffer (10mM Tris, 1 mM DTT, 0.1% CHAPS @pH 8.1)  
10  $\mu$ l ICE (50 nM final concentration to give a rate of ~1mOD/min)  
5  $\mu$ l DMSO/Inhibitor mixture  
30 20  $\mu$ l 400 $\mu$ M Substrate (80  $\mu$ M final concentration)  
100 $\mu$ l total reaction volume

The visible ICE assay is run in a 96-well microtiter plate. Buffer, ICE and DMSO (if inhibitor

- 121 -

is present) are added to the wells in the order listed. The components are left to incubate at room temperature for 15 minutes starting at the time that all components are present in all wells. The microtiter plate reader is set to incubate at 37°C. After the 15 minute incubation, substrate is added directly to the wells and the reaction is monitored by following the release of the chromophore (pNA) at 405 - 603 nm at 37°C for 20 minutes. A linear fit of the data is performed and the rate is calculated in mOD/min. DMSO is only present during experiments involving inhibitors, buffer is used to make up the volume to 100  $\mu$ l in the other experiments.

## 2. Enzyme Assay with Fluorescent Substrate

This assay is run essentially according to Thornberry et al. (Nature 356: 768-774 (1992)), using substrate 17 referenced in that article. The substrate is: Acetyl-Tyr-Val-Ala-Asp-amino-4-methylcoumarin (AMC). The following components are mixed:

65  $\mu$ l buffer (10mM Tris, 1mM DTT, 0.1% CHAPS @pH8.1)  
10  $\mu$ l ICE (2 - 10 nM final concentration)  
5  $\mu$ l DMSO/inhibitor solution  
20  $\mu$ l 150  $\mu$ M Substrate (30  $\mu$ M final)  
100 $\mu$ l total reaction volume

The assay is run in a 96 well microtiter plate. Buffer and ICE are added to the wells. The components are left to incubate at 37°C for 15 minutes in a temperature-controlled wellplate. After the 15 minute incubation, the reaction is started by adding substrate directly to the wells and the reaction is monitored @37°C for 30 minutes by following the release of the AMC fluorophore using an excitation wavelength for 380 nm and an emission wavelength of 460 nm. A linear fit of the data for each well is performed and a

- 122 -

rate is determined in fluorescence units per second.

For determination of enzyme inhibition constants ( $K_i$ ) or the mode of inhibition (competitive, uncompetitive or noncompetitive), the rate data  
5 determined in the enzyme assays at varying inhibitor concentrations are computer-fit to standard enzyme kinetic equations (see I. H. Segel, Enzyme Kinetics, Wiley-Interscience, 1975).

### 3. Cell assay

10 IL-1 $\beta$  Assay with a Mixed Population of Human Peripheral Blood Mononuclear Cells (PBMC)  
or Enriched Adherent Mononuclear Cells

Processing of pre-IL-1 $\beta$  by ICE can be measured in cell culture using a variety of cell  
15 sources. Human PBMC obtained from healthy donors provides a mixed population of lymphocyte subtypes and mononuclear cells that produce a spectrum of interleukins and cytokines in response to many classes of physiological stimulators. Adherent mononuclear  
20 cells from PBMC provides an enriched source of normal monocytes for selective studies of cytokine production by activated cells.

#### Experimental Procedure:

An initial dilution series of test compound  
25 in DMSO or ethanol is prepared, with a subsequent dilution into RPMI-10% FBS media (containing 2 mM L-glutamine, 10 mM HEPES, 50 U and 50 ug/ml pen/strep) respectively to yield drugs at 4x the final test concentration containing 0.4% DMSO or 0.4% ethanol.  
30 The final concentration of DMSO is 0.1% for all drug dilutions. A concentration titration which brackets the apparent  $K_i$  for a test compound determined in an ICE inhibition assay is generally used for the primary compound screen.

35 We generally test 5-6 compound dilutions and

- 123 -

have performed the cellular component of the assay in duplicate, with duplicate ELISA determinations on each cell culture supernatant.

PBMC Isolation and IL-1 Assay:

5                   Buffy coat cells isolated from one pint human blood (yielding 40-45 ml final volume plasma plus cells) are diluted with media to 80 ml and LeukoPREP separation tubes (Becton Dickinson) are each overlaid with 10 ml of cell suspension. After 15 min  
10                   centrifugation at 1500-1800 xg, the plasma/media layer is aspirated and then the mononuclear cell layer is collected with a Pasteur pipette and transferred to a 15 ml conical centrifuge tube (Corning). Media is added to bring the volume to 15 ml, gently mix the  
15                   cells by inversion and centrifuge at 300 xg for 15 min. Resuspend the PBMC pellet in a small volume of media, count cells and adjust to  $6 \times 10^6$  cells/ml.

For the cellular assay, add 1.0 ml of the cell suspension to each well of a 24-well flat bottom  
20                   tissue culture plate (Corning), 0.5 ml test compound dilution and 0.5 ml LPS solution (Sigma #L-3012; 20 ng/ml solution prepared in complete RPMI media; final LPS concentration 5 ng/ml). The 0.5 ml additions of test compound and LPS are usually sufficient to mix the  
25                   contents of the wells. Three control mixtures are run per experiment, with either LPS alone, solvent vehicle control, and/or additional media to adjust the final culture volume to 2.0 ml. The cell cultures are incubated for 16-18 hr at 37°C in the presence of 5%  
30                   CO<sub>2</sub>.

At the end of the incubation period, cells are harvested and transferred to 15 ml conical centrifuge tubes. After centrifugation for 10 min at 200 xg, supernatants are harvested and transferred to  
35                   1.5 ml Eppendorf tubes. It may be noted that the cell

- 124 -

pellet may be utilized for a biochemical evaluation of pre-IL-1 $\beta$  and/or mature IL-1 $\beta$  content in cytosol extracts by western blotting or ELISA with pre-IL-1 $\beta$  specific antisera.

5            Isolation of Adherent Mononuclear cells:

PBMC are isolated and prepared as described above. Media (1.0 ml) is first added to wells followed by 0.5 ml of the PBMC suspension. After a one hour incubation, plates are gently shaken and nonadherent  
10 cells aspirated from each well. Wells are then gently washed three times with 1.0 ml of media and final resuspended in 1.0 ml media. The enrichment for adherent cells generally yields  $2.5-3.0 \times 10^5$  cells per well. The addition of test compounds, LPS, cell  
15 incubation conditions and processing of supernatants proceeds as described above.

ELISA:

We have used Quantikine kits (R&D Systems) for measurement of mature IL-1 $\beta$ . Assays are performed  
20 according to the manufacturer's directions. Mature IL-1 $\beta$  levels of about 1-3 ng/ml in both PBMC and adherent mononuclear cell positive controls are observed. ELISA assays are performed on 1:5, 1:10 and 1:20 dilutions of supernatants from LPS-positive  
25 controls to select the optimal dilution for supernatants in the test panel.

The inhibitory potency of the compounds can be represented by an  $IC_{50}$  value, which is the concentration of inhibitor at which 50% of mature IL-1 $\beta$   
30 is detected in the supernatant as compared to the positive controls.

The following  $K_i$  and  $IC_{50}$  values were determined for compounds A through N using the indicated assays. Structures for compounds A through N  
35 follow this table.

Example 3

Compounds of Example 2 were synthesized as follows:

5 H. N-(N-Acetyl-tyrosinyl-valinyl-pipecolyl)-3-amino-4-oxobutanoic acid.

Step A. N-(N-tert-Butoxycarbonylpipecolyl)-4-amino-5-benzyloxy-2-oxotetrahydrofuran.

10 Reaction of N-tert-butoxycarbonylpipecolic acid (460 mg, 2.0 mmol) and N-allyloxycarbonyl-4-amino-5-benzyloxy-2-oxotetrahydrofuran (530 mg, 1.82 mmol) was carried out by a method analogous to that reported by Chapman (Bioorg. & Med. Chem. Lett. 1992, 2, 613-618.) to give 654 mg of the title compound.

15 <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>, (existing as rotamers)) δ 7.35 (m, 5H), 6.88 (br. s, 1H), 4.9-4.45 (m, 4H), 3.95 (br. m, 2H), 3.06 (m, 1H), 2.9 (m, 1H), 2.7 (br. m, 1H), 2.45 (m, 1H), 2.2 (m, 1H), 1.7-1.5 (m, 3H), 1.45 (two s, 9H).

20 Step B. N-Pipecolyl-4-amino-5-benzyloxy-2-oxotetrahydrofuran.

N-(N-tert-Butoxycarbonylpipecolyl)-4-amino-5-benzyloxy-2-oxo-tetrahydrofuran (654 mg) was dissolved in 15 ml of 25% trifluoroacetic acid in dichloromethane and stirred at room temperature. The mixture was concentrated to give a gummy residue. The residue was dissolved in dichloromethane and washed with 10% sodium bicarbonate. The organic layer was dried over anhydrous sodium sulfate, filtered, and concentrated to give 422 mg of the title compound as a beige solid.

- 129 -

<sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>) δ 7.38 (m, 5H), 7.15 (d, 1H), 5.55 (d, 1H), 4.95-4.8 (m, 1H), 4.78 (m, 1H), 4.65 (d, 1H), 4.45 (m, 1H), 3.2 (m, 0.5H), 3.05 (m, 0.5H), 2.95 (m, 0.5H), 2.85 (m, 0.5H), 2.65 (m, 1H), 2.55-2.38 (m, 1H), 1.95 (m, 1H), 1.8 (m, 1H), 1.6 (m, 2H), 1.38 (m, 2H).

Step C. N-(N-Acetyl-tyrosinyl-valinyl-pipecolyl)-4-amino-5-benzyloxy-2-oxotetrahydrofuran.

N-Acetyl-tyrosinyl-valine (464 mg, 1.44 mmol) and N-Pipecolyl-4-amino-5-benzyloxy-2-oxotetrahydrofuran (412 mg, 1.3 mmol) were dissolved in 5 ml each of dimethylformamide and dichloromethane and cooled to 0°C. To the cooled solution was added 1-hydroxybenzotriazole (HOBT; 210 mg, 1.56 mmol) followed by the addition of 1-(3-dimethylaminopropyl)-3-ethyl carbodiimide hydrochloride (EDC; 326 mg, 1.7 mmol). After stirring for 18 hours, the mixture was diluted with ethyl acetate and washed with water, 10% sodium hydrogen sulfate, 10% sodium bicarbonate, and water. The organic layer was concentrated to give a crude solid that was purified by flash chromatography (SiO<sub>2</sub>) eluting with 94:6:1 (dichloromethane:isopropanol:pyridine) to give 370 mg of the title compound.

<sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD (existing as diastereomers as well as rotamers)) δ 7.35 (m, 5H), 7.05 (m, 2H), 6.68 (m, 2H), 5.65 & 5.25 (m, 1H), 4.9-3.95 (m, 8H), 3.4-2.6 (m, 4H), 2.5-2.1 (m, 1H), 1.98 (s, 1H), 1.9 (s, 1H), 1.85 (s, 1H), 1.8-1.6 (m, 2H), 1.55-1.3 (m, 4H), 0.95-0.85 (m, 6H).

- 130 -

Step D. N-(N-Acetyl-tyrosinyl-valinyl-pipecolyl)-  
3-amino-4-oxobutanoic acid.

To a solution of 100 mg of N-(N-Acetyl-tyrosinyl-valinyl-pipecolyl)-4-amino-5-benzyloxy-2-oxotetrahydrofuran in 10 ml of methanol was added 60 mg of Pd(OH)<sub>2</sub> on carbon and the mixture placed under an atmosphere of hydrogen via a balloon. The mixture was filtered through Celite and concentrated providing a white solid. This crude solid was dissolved in 2 ml of methanol and triturated with diethyl ether affording 26 mg of the title compound.

<sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD (existing as diastereomers as well as rotamers)) δ 7.1 (m, 2H), 6.7 (m, 2H), 5.2 (br. m, 1H), 4.8-3.6 (m, 6H), 3.2-2.5 (m, 4H), 2.5-2.1 (m, 1H), 1.95 (three s, 3H), 1.9-1.3 (m, 6H), 1.1-0.7 (m, 6H).

The following compounds were prepared by a method analogous to that reported for H:

J. N-[N-Acetyl-tyrosinyl-valinyl-(4-hydroxyprolinyl)]-  
3-amino-4-oxobutanoic acid

Substitute N-tert-butoxycarbonyl-4-benzyloxyproline for N-tert-butoxycarbonylpiperic acid.

L. N-[2-(N-Acetyl-tyrosinyl-valinyl)-(S)-1,2,3,4-  
tetrahydroisoquinoline-3-carbonyl]-3-amino-  
oxobutanoic acid

Substitute (S)-N-tert-butoxycarbonyl-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid for N-tert-butoxycarbonylpiperic acid.

- 131 -

I. N-(N-Acetyl-tyrosinyl-valinyl-(4-phenoxyprolinyl))-3-amino-4-oxobutanoic acid.

Step A. N-tert-Butoxycarbonyl-4-phenoxyproline methyl ester.

5           To a cooled solution (0° C) of N-tert-butoxy-cis-4-hydroxyproline (2.0 g, 8.15 mmol), phenol (0.77 g, 8.15 mmol), and triphenylphosphine (2.14 g, 8.15 mmol) in 20 ml of tetrahydrofuran was added diethyl azodicarboxylate (1.4 ml, 9 mmol) dropwise over 30  
10 minutes. The reaction was stirred at room temperature for 16 hrs. then concentrated to give a viscous residue. The crude residue was purified by flash chromatography (SiO<sub>2</sub>) eluting with 3:7 (ethyl acetate:hexane) to give 1.89 g of the title compound.

15           <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>) δ 7.3 (m, 2H), 6.95 (m, 1H), 6.85 (d, 2H), 4.9 (m br., 1H), 4.55-4.15 (m, 2H), 3.88-3.65 (m, 1H), 3.70 (s, 3H), 2.58 (m, 1H), 2.22 (m, 1H), 1.4 (3 x s, 9H).

20           Step B. 4-Phenoxyproline methyl ester hydrochloride.

          To a cooled solution (ice bath) of N-tert-Butoxycarbonyl-4-phenoxyproline methyl ester (0.6 g) in 20 ml of ethyl acetate was bubbled anhydrous hydrogen chloride until saturated. The mixture was warmed to  
25 room temperature and stirred for 3 hrs. then concentrated to give 480 mg of the title compound.

Step C. N-Acetyl-tyrosinyl-valinyl-(4-phenoxy)proline methyl ester.

5 N-Acetyl-tyrosinyl-valine (0.524 g, 1.63 mmol) and 4-phenoxyproline methyl ester (0.381 g, 1.48 mmol) were dissolved in 4 ml each of dimethylformamide and dichloromethane and cooled to 0° C. To the cooled solution was added diisopropylethylamine (258 ul, 1.86  
10 mmol), HOBT (0.24 g, 1.78 mmol), and EDC (0.37 g, 1.92 mmol) and the reaction was stirred for 18 hrs. The mixture was diluted with 400 ml of ethyl acetate and washed with water, 10% sodium hydrogen sulfate, 10% sodium bicarbonate, and water. The organic layer was  
15 concentrated to give a residue that was purified by flash chromatography (SiO<sub>2</sub>) eluting with 94:6:1 (CH<sub>2</sub>Cl<sub>2</sub>:i-PrOH:Pyridine) to afford 360 mg of the title compound.

25 Step D. N-Acetyl-tyrosinyl-valinyl-(4-phenoxy)proline.

Lithium hydroxide (57 mg, 1.37 mmol) was added to a solution of N-Acetyl-tyrosinyl-valinyl-(4-phenoxy)proline methyl ester (360 mg, 0.685 mmol)  
30 dissolved in 8 ml of tetrahydrofuran/water (1:1) and

- 133 -

stirred at room temperature for 1 hour. The mixture was acidified with 10% hydrochloric acid giving a white precipitate that was collected to give 175 mg of the title compound.

5                   <sup>1</sup>H NMR (500 MHz, DMSO-d<sub>6</sub>) δ 9.2 (br. s, 1H),

Step E. N-[N-Acetyl-tyrosinyl-valinyl-(4-phenoxy)prolinyl]-4-amino-5-benzyloxy-2-oxotetrahydrofuran.

15                   The title compound was prepared by the method  
reported for compound H, step A, by reaction of N-acetyl-tyrosinyl-valinyl-(4-phenoxy)proline and N-allyloxycarbonyl-4-amino-5-benzyloxytetrahydrofuran.

20                   <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>, (existing as a 1:1

K. N-[N-Acetyl-tyrosinyl-valinyl-(4-benzyloxy)prolinyl]-3-amino-4-oxobutanoic acid.

Step A. N-(N-Allyloxycarbonyl-4-benzyloxyprolinyl)-3-amino-4-oxobutanoic acid tert-butyl ester semicarbazone.

The title compound was prepared by the reaction of N-allyloxycarbonyl-4-benzyloxyproline and 3-amino-4-oxobutanoic acid tert-butyl ester semicarbazone (T.L. Graybill et. al., Abstracts of papers, 206th National Meeting of the American Chemical Society, Abstract MEDI-235. Chicago, IL. (1993)) under similar peptide coupling conditions as reported above (compound H; Step C).

<sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>) δ 9.05 (br. s, 1H), 7.85 (br. m, 1H), 7.4-7.2 (m, 5H), 7.15 (br. s, 1H), 6.55 (br. s, 1H), 5.9 (m, 1H), 5.1-4.9 (br. m, 2H), 4.65-4.4 (m, 4H), 4.2 (br. m, 1H), 3.75-3.5 (m, 2H), 2.75-2.55 (m, 2H), 2.5 (br. m, 1H), 2.25 (br. m, 1H) 1.4 (s, 9H).

Step B. N-(N-Acetyl-tyrosinyl-valinyl-(4-benzyloxyprolinyl))-3-amino-4-oxobutanoic acid tert-butyl ester semicarbazone.

The title compound was prepared by reaction of N-acetyl-tyrosinyl-valine and N-(N-allyloxycarbonyl-4-

- 135 -

benzyloxyprolinyl)-3-amino-4-oxobutanoic acid t rt-butyl ester semicarbazone by reaction conditions reported for compound H, step A.

<sup>1</sup>H NMR (500MHz, CD<sub>3</sub>OD) δ 7.35-7.2 (m, 6H), 7.0 (d, 2H), 6.65(d, 2H), 4.85 (m, 1H), 4.6-4.45 (m, 4H), 4.3 (br. m, 1H), 4.15 (m, 1H), 3.7 (m, 1H), 2.95 (m, 1H), 2.75-2.6 (m, 3H), 2.35 (m, 1H), 2.1 (m, 1H), 1.9 (s, 3H), 1.4 (s, 9H), 0.95 (d, 3H), 0.90 (s, 3H).

Step C. N-(N-Acetyl-tyrosinyl-valinyl-(4-benzyloxyprolinyl))-3-amino-4oxobutanoic acid.

N-(N-Acetyl-tyrosinyl-valinyl-(4-benzyloxyprolinyl))-3-amino-4-oxobutanoic acid tert-butyl ester semicarbazone (270 mg) was dissolved into 10 ml of 25% trifluoroacetic acid in dichloromethane and stirred at room temperature for 3 hours. The mixture was concentrated to give a solid residue. The residue was dissolved into a 10 ml mixture of methanol:acetic acid:37% formaldehyde (3:1:1) and stirred at room temperature for 1 hour. The mixture was concentrated and the resulting residue purified by flash chromatography (SiO<sub>2</sub>) eluting with dichloromethane/methanol/formic acid (100:5:0.5) to give 37 mg of the title compound.

<sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD (existing as a 1:1 mixture of diastereomers of the hemiacetal)) δ 7.4-7.25 (m, 5H), 7.0 (d, 2H), 6.65 (d, 2H), 4.65-4.05 (m, 7H), 3.75-3.4 (m, 2H), 3.05-2.3 (m, 5H), 2.2-1.95 (m, 2H), 1.90 (s, 3H), 1.0 (d, 3H), 0.95 (d, 3H).

Example 5

Compounds of Example 4 were synthesized as follows:

- 139 -

3-Benzoylamino-4-oxo-4,6,7,8-tetrahydro-pyrrolo[1,2-a]pyrimidine-6-carboxylic acid methyl ester (3). A mixture of (4S)-2-amino-1-pyrroline-5-carboxylic acid ethyl ester hydrochloride (1, 0.44g, 2.38mmol; prepared in an analogous fashion as the methyl ester as described by Lee and Lown, J. Org. Chem., 52, 5717-21 (1987)); 4-ethoxymethylene-2-phenyl-2-oxazolin-5-one (2, 0.50g, 2.31mmol) and sodium methoxide (0.12g, 2.22mmol) in ethanol (10ml) was refluxed for 2h. The reaction was allowed to cool to room temperature and concentrated in vacuo. The residue was suspended in water and 1N sulfuric acid was added until pH 1 was reached. The aqueous mixture was extracted with dichloromethane, the organic layer was separated and concentrated in vacuo to yield 0.6g of a orange solid. Chromatography (flash, SiO<sub>2</sub>, 60% ethyl acetate/hexane increased to 100% ethyl acetate stepwise gradient, then 10% methanol/dichloromethane) to give 0.5g of an orange solid. A mixture of the orange solid and potassium cyanide (0.03g, 0.5mmol) in methanol (10ml) was refluxed overnight. The cooled reaction was concentrated in vacuo to give a yellow solid. Chromatography (flash, SiO<sub>2</sub>, 40% ethyl acetate/hexane to 100% ethyl acetate stepwise gradient) afforded 0.22g (31.6%) of the title compound: <sup>1</sup>H NMR (d<sub>6</sub>-DMSO) δ 2.25 (m, 1H), 2.65 (m, 1H), 3.15 (m, 2H), 3.75 (s, 3H), 5.15 (dd, 1H), 7.5 (t, 2H), 7.6 (t, 1H), 7.95 (d, 2H), 8.6 (s, 1H), 9.5 (s, 1H).

(3S)-[(3-benzoylamino-4-oxo-4,6,7,8-tetrahydro-pyrrolo[1,2-a]pyrimidine-6-carbonyl)-amino]-4-oxo-butanoic acid tert-butyl ester semicarbazone (5a and 5b). A mixture of 3-benzoylamino-4-oxo-4,6,7,8-tetrahydro-pyrrolo[1,2-a]pyrimidine-6-carboxylic acid ethyl ester (3, 0.22g 0.70mmol) and lithium hydroxide

hydrate (0.032g, 0.76mmol) in methanol (5ml) and tetrahydrofuran (5ml) and was stirred 18h at room temperature. The reaction was concentrated to give 3-benzoylamino-4-oxo-4,6,7,8-tetrahydro-pyrrolo[1,2-a]pyrimidine-6-carboxylic acid lithium salt (4) as a white solid. This was used without further purification in the subsequent reaction.

A 0°C mixture of (3S)-amino-4-oxo-butanoic acid tert-butyl ester semicarbazone (0.163g, 0.71mmol; Graybill et al., Int. J. Protein Res., 44, pp. 173-82 (1994)) and 3-benzoylamino-4-oxo-4,6,7,8-tetrahydro-pyrrolo[1,2-a]pyrimidine-6-carboxylic acid lithium salt (4) in dimethylformamide (5ml) and dichloromethane (5ml) was treated with hydroxybenzotriazole (0.104g, 0.77mmol) and 1-(3-dimethylaminopropyl)-3-ethyl carbodiimide hydrogen chloride (0.148g, 0.37mmol). The reaction was allowed to warm to room temperature and stirred 18hr. The reaction was poured onto water (50ml) and extracted with ethyl acetate (2 x 50mL). The combined organic layers were washed with aqueous 1M sodium hydrogen sulfate solution, dilute aqueous sodium hydrogen carbonate (50mL) and saturated aqueous sodium chloride. The organic layer was concentrated in vacuo to yield 0.43g of a yellow solid. Chromatography (flash, SiO<sub>2</sub>, ammonium hydroxide/methanol/dichloromethane (1:1:99 to 1:10:90 stepwise gradient)) gave 0.11g (30.9%) of the higher R<sub>f</sub> diastereomer (5a): <sup>1</sup>H NMR (CD<sub>3</sub>OD) δ 1.45 (s, 9H), 2.29-2.35 (m, 1H), 2.6-2.7 (m, 2H), 2.8 (dd, 1H), 3.1-3.15 (m, 1H), 3.2-3.3 (m, 1H), 4.9-4.95 (m, 1H), 5.2 (dd, 1H), 7.25 (d, 1H), 7.5-7.55 (m, 2H), 7.55-7.6 (m, 1H), 7.95 (d, 2H), 8.9 (s, 1H) and 0.11g (30.9%) of the lower R<sub>f</sub> diastereomer (5b): <sup>1</sup>H NMR (CD<sub>3</sub>OD) δ 1.45 (s, 9H), 2.3-2.4 (m, 1H), 2.6-2.7 (m, 1H), 2.7-2.8 (m, 2H), 3.1-3.15 (m, 1H), 3.2-3.3 (m, 1H), 4.85-4.95 (m, 1H), 5.15 (dd, 1H), 7.25

Imidazole-2-carboxylic acids 13 were prepared using modifications of described procedures (Yamanaka et al., Chem. Pharm. Bull., 31, pp. 4549-53 (1983)); Suzuki et al., J. Org. Chem., 38, pp. 3571-75 (1973)); and Oliver et al. (J. Org. Chem., 38, pp. 1437-38 (1973)).

- 144 -

Imidazole-2-carboxylic acid (13a) was prepared according to Curtis and Brown, J. Org. Chem., 45, pp. 4038-40 (1980).

5      4-Benzylimidazole-2-carboxylic acid (13b), was isolated as an off-white solid: mp. 153-155°C; IR (KBr) 3026-2624, 1630, 1515, 1498, 1438, 1405; <sup>1</sup>H NMR(d<sub>6</sub>-DMSO) δ 7.31 (5H, m), 7.14 (1H, s), 3.95 (2H, s).

10      4-(2-Phenylethyl)imidazole-2-carboxylic acid (13c), was isolated as a pale yellow solid: mp. 151-153°C; IR (KBr) 3054-2617, 1637, 1497, 1376; <sup>1</sup>H NMR(d<sub>6</sub>-DMSO) δ 7.27 (5H, m), 7.11 (1H, s), 2.92 (4H, s).

15      4-(3-Phenylpropyl)imidazole-2-carboxylic acid (13d), was isolated as a pale yellow solid: mp. 148-150°C; IR (KBr) 3020-2615, 1636, 1509, 1498, 1383; <sup>1</sup>H NMR(d<sub>6</sub>-DMSO) δ 7.35-7.22 (5H, m), 7.01 (1H, s), 2.62 (4H, m), 1.94 (2H, m).

20      4-[3-(4-Methoxyphenyl)propyl]imidazole-2-carboxylic acid (13e), was isolated as a white crystalline solid: mp. 155-156°C (decomp.); IR (KBr) 3300-2300, 1633, 1513, 1376, 1244; <sup>1</sup>H NMR(d<sub>6</sub>-DMSO) δ 9.50-7.50 (2H, bs), 7.15 (1H, s), 7.11 (2H, d, J=8.5), 6.84 (2H, d, J=8.5), 3.71 (3H, s), 2.60-2.50 (4H, m), 1.86 (2H, m). Methyl [3-(N-acetyl-O-benzyl-L-tyrosine)amino-6-benzyl-1,2-dihydro-2-oxo-pyridyl]acetate (511). A stirred mixture of methyl [3-amino-6-benzyl-1,2-dihydro-2-oxo-1-pyridyl]acetate (100mg, 0.367mmol), Boc-Tyr(Bn)-OH (136mg, 0.367mmol), dimethylformamide (1ml), diisopropylethylamine (0.25ml, 1.468mmol) and 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (118mg, 0.367mmol) was kept overnight at room temperature. The mixture was diluted with ethyl acetate, washed twice with 1M hydrochloric acid, twice with aqueous sodium bicarbonate, once with brine, then dried (MgSO<sub>4</sub>) and concentrated. The residue was purified by flash chromatography (10% ethyl acetate/dichloromethane) to afford a 162mg (70%) of a colorless oil. The oil (160mg, 0.255mmol) was dissolved in dichloromethane (1ml) and treated with trifluoroacetic acid (1ml) at 0°C. The resulting solution was allowed to reach room temperature during 40min then evaporated to dryness at 30°C. The residue was dissolved in dichloromethane then evaporated to dryness again. This procedure was repeated three times. The residue was dissolved in pyridine (0.5ml) and treated with acetic anhydride (0.03ml, 0.3mmol) at 0°C. The resulting mixture was allowed to reach room temperature and kept for 3.5h. It was diluted with ethyl acetate, washed twice with 1M hydrochloric acid, twice with aqueous sodium bicarbonate, dried (MgSO<sub>4</sub>) and concentrated to afford 128mg (86%) of a colorless oil: IR (film) 3290, 1751, 1649, 1602, 1568, 1513, 1455, 1438, 1375, 1224, 1179; <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 8.78 (1H, s), 8.33 (1H, d, J = 7.6), 7.33 (8H, m), 7.11 (4H, m), 6.86 (2H, d, J = 8.5), 6.47 (1H, d, J = 7.6), 6.12 (1H, d, J = 7.6), 4.99 (2H, s), 4.85 (1H, m), 4.69 (2H, s), 3.87 (2H, s), 3.62 (3H, s), 3.08 (2H, m), 1.96 (3H, s).

5     **N-(N-Acetyl-tyrosinyl-valinyl-(4(R)-allyloxy prolinyl))-3(S)-amino-4-oxobutanoic acid (85).**

Step A.     **N-tert-Butoxycarbonyl-4(R)-**

**allyloxyproline.** N-tert-Butoxycarbonyl(4R)-

hydroxyproline (9.25 g, 40 mmol) was added to a

10     solution of 60% sodium hydride (3.36 g, 84 mmol) in 100 ml of anhydrous tetrahydrofuran and stirred for 2 hours at room temperature. Allyl bromide (6.9 ml, 80 mmol) was added to the mixture and refluxed for 6 hours. The mixture was quenched with the addition of

15     ice chips, then additional water was added and the mixture was washed with hexane. The aqueous layer was acidified with 10% sodium hydrogen sulfate and extracted with ethyl acetate (2 x 150 ml). The combined extracts were dried over anhydrous sodium

20     sulfate, filtered and evaporated to give 5 g of the title product with no further purification.

Step B. 4(R)-Allyloxyprolin methyl ester hydrochloride. N-tert-Butoxycarbonyl-4(R)-allyloxyproline (5 g, 18.4 mmol) was refluxed in 50 ml of saturated methanolic hydrogen chloride for 6 hours. The mixture was evaporated in vacuo to give 3.78 g of a yellow gum as the title compound: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 5.83-5.72 (1H, m), 5.24-5.14 (1H, d), 5.13-5.08 (1H, d), 4.55-4.3 (3H, m), 4.25-4.15 (1H, m), 3.9 (1.5H, s), 3.78 (1.5H, s), 3.7-3.28 (3H, m), 2.45-2.32 (1H, m), 2.2-2.05 (1H, m).

Step C. N-Acetyl-tyrosinyl-valinyl-(4(R)-allyloxyproline) methyl ester. 4(R)-Allyloxyproline methyl ester hydrochloride (1.05 g, 4.75 mmol) and N-acetyl-Tyr-Val-OH (1.68 g, 5.21 mmol) were dissolved in 10 ml of a 1:1 mixture of dichloromethane and dimethylformamide and cooled to 0 °C. Diisopropylethylamine (1 ml, 5.93 mmol) was added to the cooled mixture followed by the addition of N-hydroxybenzotriazole (0.769 g, 5.69 mmol) and 1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (1.18 g, 6.2 mmol). After stirring for 2 hours, the mixture was warmed to room temperature and stirred for 16 hours. The reaction was poured into 150 ml of ethyl acetate and washed with 50ml each of water, 10% sodium hydrogen sulfate, and 10% sodium bicarbonate. The organic layer was dried over sodium sulfate, filtered, and evaporated to give a light yellow solid. This was purified by flash chromatography eluting with dichloromethane/methanol/pyridine (100:3:0.5) to give 780 mg of the title compound. <sup>1</sup>H NMR (CD<sub>3</sub>OD) δ 7.02-6.96 (2H, d), 6.67-6.63 (2H, d), 5.95-5.85 (1H, m),

Step D. N-(N-Acetyl-tyrosinyl-valinyl-(4(R)-allyloxyprolinyl))-3(S)-amino-4-oxobutanoic acid tert-butyl ester semicarbazone. N-Acetyl-tyrosinyl-valinyl-(4-allyloxyproline) methyl ester (770 mg, 1.57 mmol) was dissolved in 20 ml of tetrahydrofuran and 4 ml of methanol. Lithium hydroxide (145 mg, 3.46 mmol) was added to the mixture and stirred at room temperature. After two hours, 1 ml of 10% hydrogen chloride was added and the mixture evaporated in vacuo to give a solid residue then partitioned between 5ml of water and 50 ml of ethyl acetate and the organic layer separated and evaporated in vacuo to give 430 mg of the acid that was used immediately in the next step.

N-Acetyl-tyrosinyl-valinyl-4-allyloxyproline (420 mg, 0.88 mmol) and 3-amino-4-oxobutyric acid tert-butyl ester semicarbazone (184 mg, 0.8 mol, Graybill et al., Int. J. acid salt (114a):

Step A. To a solution of tert-butyl-2-N-benzyloxycarbonyl-3-N-benzyl-(S)-2,3-diaminopropionate (110; 0.85 g, 2.2 mmol), 3-(N-tert-butoxycarbonyl)amino-2-methyl-5-oxo-pentanoic acid methyl ester (109a; 0.65 g, 2.7 mmol), acetic acid (0.1 mL, 1.8 mmol), sodium acetate (0.36 g, 2

- 258 -

mmol) and 4 Å molecular sieves (1 g) in methanol (45 mL), was added sodium cyanoborohydride (0.33 g, 5.3 mmol). The mixture was stirred overnight at 25 °C then filtered through Celite and concentrated under reduced pressure. The residue was dissolved in 1 N NaOH and extracted with ethyl acetate (3 x 40 mL). The organic layer was dried (MgSO<sub>4</sub>), filtered and evaporated to give an oil. Chromatography (silica-gel, 4:1 hexane: ethyl acetate as eluent) gave 0.92 g (68% yield) of 111a as an oil.

Step B. The above material was dissolved in dichloromethane (3 mL) cooled to 0 °C and treated with a 25% solution of trifluoroacetic acid in dichloromethane (20 mL) then allowed to warm to 25 °C and stir until the reaction was judged complete by TLC (4:1 hexane: ethyl acetate). The solvent was removed under reduced pressure and the residue dried under vacuum then dissolved in dichloromethane (40 mL) and treated with 4-methylmorpholine (1 mL, 9 mmol), HOBT (0.2g, 1.5 mmol) and EDC (0.61 g, 3.2 mmol). The resulting mixture was stirred overnight at 25 °C then diluted with dichloromethane and washed with water. The organic layer was dried (MgSO<sub>4</sub>), filtered and evaporated to give an oil. Chromatography (silica-gel, 3:2 hexane: ethyl acetate) gave 0.49 g (74% yield) of 112a as a viscous oil.

Step C. A solution of 2(R,S)-[4-benzyl-7-oxo-6(S)-(N-benzyloxycarbonylamino)-[1,4]diazepan-1-yl]-propionic acid methyl ester (112a; 0.15 g, 0.32 mmol) was dissolved in methanol and treated with 1 M LiOH (0.32 mL) and stirred 5.5 hours at 25 °C then evaporated to dryness. The residue was azeotroped with ethanol (2 x 10 mL), acetonitrile (2 x 10 mL),

- 259 -

benzene (2 x 10 mL) then dried under vacuum. The resulting residue was converted to 114a by a method similar to that described in example 3, compound K (steps A, B, and C) and purified by reverse phase (C18 column) HPLC using 0.1%TFA:water/  
5 0.1%TFA:acetonitrile as eluent. to give 17 mg (10% yield) of a viscous oil: <sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD) δ 1.15 (m, 3 H), 2.30- 2.70 (m, 6 H), 2.72- 2.95 (bm, 6 H), 3.30- 3.80 (m, 4 H), 4.10 (m, 1 H), 4.40 (m, 4

3(S)-{2-[4-Benzyl-7-oxo-6(S)-(N-benzyloxycarbonylamino)-[1,4]diazepan-1-yl]-acetylamino}-4-oxo-butyric acid trifluoroacetic acid  
15 salt (114b) was prepared from 109b by a similar method described for the synthesis of 114a to give 85 mg of viscous oil: <sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD) δ 1.20 (d, J = 7 Hz, 3 H), 2.28 (m, 2 H), 2.60 (m, 2 H), 3.18 (bs, 6 H), 3.35- 3.45 (m, 2 H), 3.60- 3.95 (m, 2  
20 H), 4.15 (m, 1 H), 4.32 (m, 1 H), 4.42 (m, 1 H), 5.00 (bm, 2 H), 7.20 (bs, 5 H), and 7.40 ppm (bs, 5 H); <sup>19</sup>F NMR (470 MHz, CD<sub>3</sub>OD) δ -10.72 ppm (s, 3 F).

Step D. A suspension of 2(R,S)-[4-benzyl-7-oxo-6(S)-(N-benzyloxycarbonylamino)-[1,4]diazepan-1-yl]-propionic acid methyl ester (112b; 0.22 g, 0.49 mmol) and 20% Pd(OH)<sub>2</sub> on carbon (50 mg) in ethanol was  
30 stirred under hydrogen atmosphere for 7 hours. The solvent was evaporated under reduced pressure and the

residue dissolved in dichloromethane (20 mL) then treated with triethylamine (1 mL) and dihydrocinnamoyl chloride (170 mg, 1 mmol). The resulting mixture was allowed to stir overnight then  
5 diluted with ethyl acetate and washed with 1 N NaOH. The organic layer was dried ( $\text{MgSO}_4$ ), filtered and evaporated to give an oil. Chromatography (silica-gel, 4:1 hexane: ethyl acetate) gave 0.175 g (75% yield) of 113 as an oil.

10 Step C. A 0.15 g sample of 113 (0.32 mmol) was dissolved in methanol, treated with 1 M LiOH (0.32 mL), stirred at 40 °C overnight then evaporated to dryness. The residue was azeotroped with ethanol (2 x 10 mL), acetonitrile (2 x 10 mL), benzene (2 x 10  
15 mL) then dried under vacuum. The resulting residue was converted to 115 by a method similar to that described in example 3, compound X (steps A, B, and C).

3-{2-[2,4-Dibenzyl-3,7-dioxo-6-(N-benzyloxycarbonylamino)-[1,4]diazepan-1-yl]-acetylamino}-4-oxo-butyric acid (121):

- 5 Step E. A solution of tert-butyl-2-N-carbobenzoxy-3-N-benzyl-(S)-2,3-diaminopropionate (110; 1.77 g, 4.6 mmol), N-allyl-N-tert-butoxycarbonyl-(S)-phenylalanine (116; 1.04 g, 4.8 mmol), HOBT (0.74 g, 5.5 mmol) and EDC (1.33 g, 6.9 mmol) in
- 10 dichloromethane (50 mL) was allowed to stir at 25 °C for 16 h then diluted with dichloromethane (100 mL) and washed with water. The organic layer was dried (MgSO<sub>4</sub>), filtered and evaporated to give an oil. Chromatography (silica-gel, 85: 15 hexane: ethyl

- 262 -

acetate) gave 1.34 g (43% yield) of 117 as a colorless viscous oil.

Step F. A 1.34 g sample of 117 was dissolved in dichloromethane (3 mL) and treated with a 50%  
5 solution of trifluoroacetic acid in dichloromethane (20 mL). After 1.5 h, the solvent was removed under reduced pressure and the residue dried under vacuum then dissolved in dichloromethane (50 mL) and combined with 4-methylmorpholine (0.2 mL, 2 mmol),  
10 HOBT (0.27 g, 2 mmol) and EDC (0.8 g, 4 mmol). The mixture was stirred overnight at 25 °C then diluted with dichloromethane and washed with water. The organic layer was dried (MgSO<sub>4</sub>), filtered and evaporated to give an oil. Chromatography (silica-gel, 7:3 hexane: ethyl acetate) gave 0.8 g (80%  
15 yield) of 118 as a viscous oil.

Step G. A 0.8 g sample of 118 was dissolved in methanol (40 mL), cooled to -78 °C and saturated with ozone until the solution was blue in color. The  
20 excess ozone was removed by purging with argon then dimethylsulfide (5 mL) was added and the mixture allowed to warm to 25 °C and stir 3 h. Solvent removal and chromatography (silica-gel, 1:1 hexane: ethyl acetate ) gave 0.74 g (74% yield) of 119 as a  
25 white solid.

Step H. A 0.2 g sample (0.4 mmol) of 119 was dissolved in acetone (25 mL), cooled to 0 °C and treated dropwise with a solution of Jones reagent until the orange color persisted. 2-Propanol (5 mL)  
30 was then added to the mixture and the resulting solution filtered through Celite and washed with acetone. Solvent removal gave a green-white solid that was dried under vacuum to give 120. The resulting residue was converted to 121 by a method

similar to that described in example 3, compound K (steps A, B, and C). Chromatography (SiO<sub>2</sub>, 95: 4.5: 0.5 dichloromethane: methanol: acetic acid eluent) gave 85 mg (53% yield) of cream colored solid which was identified as 3-{2-[2,4-dibenzyl-3,7-dioxo-6-(N-benzyloxycarbonylamino)-[1,4]diazepan-1-yl-acetylamino]-4-oxo-butyric acid (121) on the basis of the following spectral data: <sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD) δ 2.38 (m, 1 H), 2.45 (m, 1 H), 3.21 (bs, 2 H), 3.32-3.39 (bm, 6 H), 3.85 (m, 1 H), 4.05 (m, 1 H), 4.21 (bm, 1 H), 4.31 (bs, 1 H), 4.45 (dm, J = 11 Hz, 1 H), 4.95 (bs, 4 H), 7.20 (bs, 5 H), and 7.33- 7.45 ppm (m, 5 H); <sup>19</sup>F NMR (470 MHz, CD<sub>3</sub>OD) δ -10.62 ppm (s, 3 F).

The data of the examples above demonstrate  
that compounds according to this invention display  
inhibitory activity towards IL-1 $\beta$  Converting Enzyme.

Insofar as the compounds of this invention  
are able to inhibit ICE in vitro and furthermore, may  
be delivered orally to mammals, they are of evident  
clinical utility for the treatment of IL-1 mediated  
diseases. These tests are predictive of the  
compounds ability to inhibit ICE in vivo.

While we have described a number of  
embodiments of this invention, it is apparent that  
our basic constructions may be altered to provide  
other embodiments which utilize the products and  
processes of this invention. Therefore, it will be  
appreciated that the scope of this invention is to be  
defined by the appended claims, rather than by the  
specific embodiments which have been presented by way  
of example.

CLAIMS

We claim:

1. An ICE inhibitor comprising:
  - (a) a first and a second hydrogen  
5 bonding moiety, each of said moieties being capable  
of forming a hydrogen bond with a different backbone  
atom of ICE, said backbone atom being selected from  
the group consisting of the carbonyl oxygen of  
Arg-341, the amide -NH- group of Arg-341, the  
10 carbonyl oxygen of Ser-339 and the amide -NH- group  
of Ser-339;
  - (b) a first and a second moderately  
hydrophobic moiety, said moieties each being capable  
of associating with a separate binding pocket of ICE  
15 when the inhibitor is bound thereto, said binding  
pocket being selected from the group consisting of  
the P2 binding pocket, the P3 binding pocket, the P4  
binding pocket and the P' binding pocket; and
  - (c) an electronegative moiety  
20 comprising one or more electronegative atoms, said  
atoms being attached to the same atom or to adjacent  
atoms in the moiety and said moiety being capable of  
forming one or more hydrogen bonds or salt bridges  
with residues in the P1 binding pocket of ICE.
- 25 2. The ICE inhibitor according to claim 1,  
wherein said inhibitor is characterized by a neutral  
or favorable enthalpic contribution from the sum of  
all electrostatic interactions between the inhibitor  
and ICE when the inhibitor is bound thereto.
- 30 3. The ICE inhibitor according to claim 1,  
wherein said inhibitor has a molecular weight less  
than or equal to about 700 Daltons.

- 269 -

4. The ICE inhibitor according to claim 3, wherein said inhibitor has a molecular weight between about 400 and about 600 Daltons.

5 5. The ICE inhibitor according to claim 1, wherein said inhibitor further comprises less than two secondary amide bonds.

6. The ICE inhibitor according to claim 1, wherein said inhibitor further comprises less than two groups selected from the set consisting of  
10 secondary amide groups and carbamate groups.

7. The ICE inhibitor according to claim 1, wherein said inhibitor further comprises a polysubstituted cyclic group having between three and seven substituents, said cyclic group not comprising  
15 the first or second moderately hydrophobic moiety or the electronegative moiety.

8. The ICE inhibitor according to claim 1 or 7, wherein said inhibitor is characterized by a strain energy of binding of said inhibitor to ICE  
20 less than or equal to about 10 kcal/mole.

9. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE at least two of the following four conditions 1) through 4) are met:

25 1) one of said moderately hydrophobic moieties associates with the P2 binding pocket of ICE, in such a way that:

a) the distance from the center of mass of the moderately hydrophobic moiety in the P2

- 270 -

binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 7.1Å and about 12.5Å;

5           b) the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the amide nitrogen of Arg-341 of ICE is between about 6.0Å and about 12Å; and

10           c) the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 3.7Å and about 9.5Å;

2) one of said moderately hydrophobic moieties associates with the P3 binding pocket of ICE in such a way that:

15           a) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 3.9Å and about 9.5Å;

20           b) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the amide nitrogen of Arg-341 of ICE is between about 5.4Å and about 11Å; and

25           c) the distance from the center of mass of the moderately hydrophobic moiety in the P3 binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 7.0Å and about 13Å;

3) one of said moderately hydrophobic moieties associates with the P4 binding pocket of ICE in such a way that:

30           a) the distance from the center of mass of the moderately hydrophobic moiety in the P4 binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 4.5Å and about 7.5Å;

          b) the distance from the center of mass of the moderately hydrophobic moiety in the P4

- 271 -

binding pocket to the amid nitrogen of Arg-341 of ICE is between about 5.5Å and about 8.5Å; and

5 c) the distance from the center of mass of the moderately hydrophobic moiety in the P<sub>4</sub> binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 8Å and about 11Å; and

4) one of said moderately hydrophobic moieties associates with the P' binding pocket of ICE in such a way that:

10 a) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the carbonyl oxygen of Arg-341 of ICE is between about 11Å and about 16Å;

15 b) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the amide nitrogen of Arg-341 of ICE is between about 10Å and about 15Å; and

20 c) the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the carbonyl oxygen of Ser-339 of ICE is between about 8Å and about 12Å.

10. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE, said moderately hydrophobic moieties separately  
25 associate with the P' binding pocket of ICE and the P<sub>2</sub> binding pocket of ICE and the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the center of mass of the moderately hydrophobic moiety in the P<sub>2</sub> binding  
30 pocket is between about 6.5Å and about 13Å.

11. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE,

- 272 -

said moderately hydrophobic moieties separately associate with the P' binding pocket of ICE and the P3 binding pocket of ICE and the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the center of mass of the moderately hydrophobic moiety in the P3 binding pocket is between about 6Å and about 15Å.

12. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE, said moderately hydrophobic moieties separately associate with the P' binding pocket of ICE and the P4 binding pocket of ICE and the distance from the center of mass of the moderately hydrophobic moiety in the P' binding pocket to the center of mass of the moderately hydrophobic moiety in the P4 binding pocket is between about 14Å and about 22Å.

13. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE, said moderately hydrophobic moieties separately associate with the P2 binding pocket of ICE and the P3 binding pocket of ICE and the distance from the center of mass of the moderately hydrophobic moiety in the P2 binding pocket to the center of mass of the moderately hydrophobic moiety in the P3 binding pocket is between about 5.5Å and about 13Å.

14. The ICE inhibitor according to claim 1 or 7, wherein when said inhibitor is bound to ICE, said moderately hydrophobic moieties separately associate with the P2 binding pocket of ICE and the P4 binding pocket of ICE and the distance from the center of mass of the moderately hydrophobic moiety

- 273 -

in the P2 binding pocket to the center of mass of the moderately hydrophobic moiety in the P4 binding pocket is between about 9Å and about 17Å.

5           15. The ICE inhibitor according to claim 1  
or 7, wherein when said inhibitor is bound to ICE,  
said moderately hydrophobic moieties separately  
associate with the P3 binding pocket of ICE and the  
P4 binding pocket of ICE and the distance from the  
center of mass of the moderately hydrophobic moiety  
10 in the P3 binding pocket to the center of mass of the  
moderately hydrophobic moiety in the P4 binding  
pocket is between about 7.5Å and about 17Å.

15           16. The ICE inhibitor according to claim 1  
or 7, wherein when said inhibitor is bound to ICE,  
said first hydrogen bonding moiety forms a hydrogen  
bond with the carbonyl oxygen of Ser-339 of ICE and  
said second hydrogen bonding moiety forms a hydrogen  
bond with the carbonyl oxygen of Arg-341 of ICE and  
wherein the distance between said hydrogen bonding  
20 moieties is between about 5Å and about 7.5Å.

25           17. The ICE inhibitor according to claim 1  
or 7, wherein when said inhibitor is bound to ICE,  
said first hydrogen bonding moiety forms a hydrogen  
bond with the carbonyl oxygen of Ser-339 of ICE and  
said second hydrogen bonding moiety forms a hydrogen  
bond with the amide -NH- group of Arg-341 of ICE and  
wherein the distance between said moieties is between  
about 2.5Å and about 5Å.

30           18. The ICE inhibitor according to claim 1  
or 7, wherein when said inhibitor is bound to ICE,

- 274 -

said first hydrogen bonding moiety forms a hydrogen bond with the carbonyl oxygen of Arg-341 of ICE and said second hydrogen bonding moiety forms a hydrogen bond with the amide -NH- group of Arg-341 of ICE and wherein the distance between said hydrogen bonding moieties is between about 2.5Å and about 4Å.

19. An ICE inhibitor comprising:

(a) a scaffold of formula I:

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

W<sub>1</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms through bonds r;

W<sub>2</sub> is a straight chain comprising 3-5 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms through bonds r;

each bond labeled r is independently a single or a double bond;

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen

- 275 -

bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

(b) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

(c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

20. The ICE inhibitor according to claim 19, wherein said scaffold has the formula:

(IA)

wherein:

each X is independently C or N;

$W_{14}$  is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or

- 276 -

unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r; and

5 each bond labeled r is independently a single or a double bond.

21. The ICE inhibitor according to claim 19, wherein said scaffold has the formula:

(IB)

wherein:

10

X is C or N;

15

W<sub>1a</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms through bonds r;

20

W<sub>2a</sub> is a straight chain comprising 3-4 covalently bound members independently selected from the group consisting of C, N, S and O, said chain comprising two ends which are covalently bound to two different atoms to form an aryl or heteroaromatic ring therewith; and

25

each bond labeled r is independently a single or a double bond.

- 277 -

22. The ICE inhibitor according to claim 19,  
wherein said scaffold has the formula:

(IC)

wherein:

- 5                   each X is independently C or N;  
                  each X<sub>1</sub> is independently C, N, or O; and  
                  W<sub>14a</sub> is a straight chain comprising 1-3  
covalently bound members independently selected from  
the group consisting of C, N, S and O, said covalent  
10 bonds between said members being saturated or  
unsaturated and said chain comprising two ends which  
are covalently bound to two different X<sub>1</sub> atoms to  
form a non-aromatic ring therewith.

23. An ICE inhibitor comprising:  
15 a scaffold of formula II:

(II)

wherein:

- each X is independently C or N;  
                  Z is CO or SO<sub>2</sub>;  
20                   W<sub>3</sub> is a straight chain comprising 2-4  
covalently bound members independently selected from  
the group consisting of C, N, S and O, said covalent  
bonds between said members being independently  
saturated or unsaturated and said chain comprising  
25 two ends which are covalently bound to two different  
X atoms through bonds r;  
                  each bond labeled r is independently a  
single or a double bond;

- 278 -

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

(a) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

(b) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

24. The ICE inhibitor according to claim 23, wherein said scaffold has the formula:

(IIA)

wherein:

each X is independently C or N;  
Z is CO or SO<sub>2</sub>;

- 279 -

W<sub>15</sub> is a straight chain comprising 1-2 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms; and

the bond labeled r is a single or a double bond.

25. The ICE inhibitor according to claim 23, wherein said scaffold has the formula:

(IIB)

wherein:

each X is independently C or N; and  
Z is CO or SO<sub>2</sub>.

26. The ICE inhibitor according to claim 23, wherein said scaffold has the formula:

(IIC)

wherein:

each X is independently C or N;  
Z is CO or SO<sub>2</sub>;

W<sub>16</sub> is a straight chain comprising 1-2 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising

- 280 -

two ends which are covalently bound to two different C atoms through bonds r; and

each bond labeled r is independently a single or a double bond.

- 5                    27. An ICE inhibitor comprising:  
                       (a) a scaffold of formula III:

(III)

, wherein:

- 10                    each X is independently C or N;  
                       Z is CO or SO<sub>2</sub>;  
                       W<sub>4</sub> is a straight chain comprising 2-4  
                       covalently bound members independently selected from  
                       the group consisting of C, N, S and O, said covalent  
 15                    bonds between said members being independently  
                       saturated or unsaturated and said chain comprising  
                       two ends which are covalently bound to two different  
                       atoms;  
                       W<sub>5</sub> is a direct bond or a straight chain  
 20                    comprising 1-2 covalently bound members independently  
                       selected from the group consisting of C, N, S and O,  
                       said covalent bonds between said members being  
                       independently saturated or unsaturated and said chain  
                       comprising two ends which are covalently bound to two  
 25                    different X atoms through bonds r;  
                       W<sub>6</sub> is a straight chain comprising 3-5  
                       covalently bound members independently selected from  
                       the group consisting of C, N, S and O, said covalent  
                       bonds between said members being independently  
 30                    saturated or unsaturated and said chain comprising  
                       two ends which are covalently bound to two different  
                       X atoms through bonds r;

- 281 -

each bond labeled  $r$  is independently a single or a double bond;

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

(b) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

(c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

28. The ICE inhibitor according to claim 27, wherein said scaffold has the formula:

(IIIA)

wherein:

- 282 -

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

W<sub>5</sub> is a direct bond or a straight chain comprising 1-2 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms;

W<sub>17</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r; and

each bond labeled r is independently a single or a double bond.

29. The ICE inhibitor according to claim 27, wherein:

(IIIB)

wherein:

each X is independently C or N;

W<sub>17</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r; and

each bond labeled r is independently a

- 283 -

single or a double bond.

30. An ICE inhibitor comprising:

(a) a scaffold of formula IV:

5

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

10

W<sub>7</sub> is a straight chain comprising 3-5 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms through bonds r;

15

W<sub>8</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated, and said chain comprising two ends which are covalently bound to two different X atoms through bonds r;

20

each bond labeled r is independently a single or a double bond;

25

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide

30

- 284 -

-NH- group of Ser-339;

(b) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

(c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

31. The ICE inhibitor according to claim 30, wherein said scaffold has the formula:

(IVA)

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

W<sub>18</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r; and

each bond labeled r is independently a

- 285 -

single or a double bond.

32. The ICE inhibitor according to claim 30, wherein said scaffold has the formula:

(IVB)

5

wherein:

each X is independently C or N; and

Z is CO or SO<sub>2</sub>.

33. The ICE inhibitor according to claim 30, wherein said scaffold has the formula:

10

(IVC)

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

W<sub>8a</sub> is a straight chain comprising 1-3

15

covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms; and

20

the bond labeled r is a single or a double bond.

- 286 -

34. The ICE inhibitor according to claim 30, wherein said scaffold has the formula:

(IVD)

wherein:

5 Z is CO or SO<sub>2</sub>;

W<sub>8a</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r;

W<sub>19</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r; and

20 each bond labeled r is independently a single or a double bond.

35. The ICE inhibitor according to claim 30, wherein said scaffold has the formula:

(IVE)

wherein:

25 Z is CO or SO<sub>2</sub>;

W<sub>8a</sub> is a straight chain comprising 1-3 covalently bound members independently selected from

- 287 -

the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms;

5  $W_7$  is a straight chain comprising 3 covalently bound members independently selected from the group consisting of C, N, S and O, said chain comprising two ends which are covalently bound to two different C atoms to form an aryl ring therewith; and  
10 the bond labeled r is a single or a double bond.

36. An ICE inhibitor comprising:

a) a scaffold of formula V:

15 (V)

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

20  $W_9$  is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising  
25 two ends which are covalently bound to two different X atoms through bonds r;

$W_{10}$  is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent  
30 bonds between said members being independently saturated or unsaturated and said chain comprising

- 288 -

two ends which are covalently bound to two different X atoms through bonds r;

each bond labeled r is independently a single or a double bond;

5 H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the  
10 carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

b) a first and a second moderately hydrophobic moiety, said moieties each being  
15 covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding  
20 pocket, the P4 binding pocket and the P' binding pocket; and

c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the  
25 moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

37. The ICE inhibitor according to claim 36,  
30 wherein said scaffold has the formula:

- 289 -

(VA)

wherein:

each X is independently C or N; and  
Z is CO or SO<sub>2</sub>.

5

38. The ICE inhibitor according to claim 36,  
wherein said scaffold has the formula:

(VB)

wherein:

each X is independently C or N;  
Z is CO or SO<sub>2</sub>;

W<sub>9a</sub> is a straight chain comprising 1-3  
covalently bound members independently selected from  
the group consisting of C, N, S and O, said covalent  
bonds between said members being independently  
saturated or unsaturated and said chain comprising  
two ends which are covalently bound to two different  
C atoms; and

the bond labeled r is a single or a  
double bond.

10

15

20

39. The ICE inhibitor according to claim 36,  
wherein said scaffold has the formula:

(VC)

wherein:

each X is independently C or N;

25

- 290 -

Z is CO or SO<sub>2</sub>;

W<sub>10a</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different X atoms; and

the bond labeled r is a single or a double bond.

40. An ICE inhibitor comprising:

(a) a scaffold of formula VI:

(VI)

wherein:

each X is independently C or N;

Z is CO or SO<sub>2</sub>;

W<sub>11</sub> is a straight chain comprising 3-5 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms to form a ring which may optionally be benzofused or pyridinofused;

W<sub>12</sub> is a straight chain comprising 4-6 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to the indicated X atom through bonds r;

each bond labeled r is independently a

- 291 -

single or a double bond;

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

(b) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

(c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

41. The ICE inhibitor according to claim 40, wherein said scaffold has the formula:

(VIA)

wherein:

each X and X<sub>b</sub> is independently C or N;

- 292 -

Z is CO or SO<sub>2</sub>;

W<sub>12a</sub> is a straight chain comprising 4-6 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent  
 5 bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to the indicated X<sub>b</sub> atom through bonds r; and

each bond labeled r is independently a single  
 10 or a double bond.

42. The ICE inhibitor according to claim 40, wherein said scaffold has the formula:

(VIB)

wherein:

15 each X is independently C or N;  
 Z is CO or SO<sub>2</sub>;

W<sub>20</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent  
 20 bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different C atoms through bonds r;

W<sub>21</sub> is a straight chain comprising 1-2 covalently bound members independently selected from the group consisting of C, N, S and O, said chain  
 25 comprising two ends which are covalently bound to two different C atoms to form an aryl ring therewith; and  
 each bond labeled r is independently a  
 30 single or a double bond.

- 293 -

43. An ICE inhibitor comprising:

(a) a scaffold of formula VII:

X is C or N;

Z is CO or SO<sub>2</sub>;W<sub>13</sub> is a straight chain comprising 3-5

covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms;

the bond labeled r is a single or a

double bond;

H is a first hydrogen bonding moiety and Z is a second hydrogen bonding moiety, each of said moieties being capable of forming a hydrogen bond with a different backbone atom of ICE, said backbone atom being selected from the group consisting of the carbonyl oxygen of Arg-341, the amide -NH- group of Arg-341, the carbonyl oxygen of Ser-339 and the amide -NH- group of Ser-339;

(b) a first and a second moderately hydrophobic moiety, said moieties each being covalently bound to said scaffold and each being capable of associating with a separate binding pocket of ICE when the inhibitor is bound thereto, said binding pocket being selected from the group consisting of the P2 binding pocket, the P3 binding pocket, the P4 binding pocket and the P' binding pocket; and

- 294 -

(c) an electronegative moiety comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

44. The ICE inhibitor according to claim 43, wherein said scaffold has the formula:

each X is independently C or N; and  
Z is CO or SO<sub>2</sub>.

45. The ICE inhibitor according to claim 43, wherein said scaffold has the formula:

X is C or N;  
Z is CO or SO<sub>2</sub>;

20 W<sub>22</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms; and

the bond labeled r is a single or a double bond.

- 295 -

46. The ICE inhibitor according to claim 43, wherein said scaffold has the formula:

(VIIC)

wherein:

X is C or N;

Z is CO or SO<sub>2</sub>;

W<sub>23</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms; and

the bond labeled r is a single or a double bond.

47. The ICE inhibitor according to claim 43, wherein said scaffold has the formula:

(VIID)

wherein:

X is C or N;

Z is CO or SO<sub>2</sub>;

W<sub>22a</sub> is a straight chain comprising 1-3 covalently bound members independently selected from the group consisting of C, N, S and O, said covalent bonds between said members being independently saturated or unsaturated and said chain comprising two ends which are covalently bound to two different atoms through bonds r; and

- 296 -

each bond labeled r is independently a single or a double bond.

48. An ICE inhibitor comprising:

- a) a scaffold comprising any  
5 monocyclic, bicyclic or tricyclic system, wherein  
each ring of said system comprises 5-7 members, said  
system comprising C, N, O or S, said system being  
aromatic or non-aromatic and comprising a central  
ring, wherein the distance between the centroid of  
10 said central ring and the alpha carbon of Cys-285 of  
ICE is between about 5.0Å and about 6.0Å when the  
inhibitor is bound to ICE and the distance between  
the centroid of said central ring and the alpha  
carbon of His-237 of ICE is between about 5.5Å and  
15 about 6.5Å when the inhibitor is bound to ICE;
- b) a first hydrogen bonding moiety and  
a second hydrogen bonding moiety, each of said  
moieties being capable of forming a hydrogen bond  
with a different backbone atom of ICE, said atoms  
20 being selected from the group consisting of the  
carbonyl oxygen of Arg-341, the amide -NH- group of  
Arg-341, the carbonyl oxygen of Ser-339 and the amide  
-NH- group of Ser-339;
- c) a first and a second moderately  
25 hydrophobic moiety, said moieties each being  
covalently bound to said scaffold and each being  
capable of associating with a separate binding pocket  
of ICE when the inhibitor is bound thereto, said  
binding pocket being selected from the group  
30 consisting of the P2 binding pocket, the P3 binding  
pocket, the P4 binding pocket and the P' binding  
pocket; and
- d) an electronegative moiety

- 297 -

comprising one or more electronegative atoms, said atoms being attached to the same atom or to adjacent atoms in the moiety and said moiety being covalently bound to said scaffold and being capable of forming one or more hydrogen bonds or salt bridges with residues in the P1 binding pocket of ICE.

each R<sub>10</sub> is independently selected from the group consisting of -H or a -C<sub>1-6</sub> straight or branched alkyl group;

- 25       each R<sub>11</sub> is independently selected from the group consisting of H, R<sub>9</sub>, Ar<sub>2</sub>, and -CH<sub>2</sub>-T<sub>1</sub>-R<sub>9</sub>,

- 30       each Ar<sub>1</sub> is a cyclic group independently selected from the set consisting of an aryl group which contains 6, 10, 12, or 14 carbon atoms and between 1 and 3 rings, a cycloalkyl group which contains between 3 and 15 carbon atoms and between 1 and 3

- 360 -

rings, said cycloalkyl group being optionally  
 benzofused, and a heterocycle group containing  
 between 5 and 15 ring atoms and between 1 and 3  
 rings, said heterocycle group containing at least one  
 5 heteroatom group selected from -O-, -S-, -SO-, -SO<sub>2</sub>-,  
 =N-, and -NH-, said heterocycle group optionally  
 containing one or more double bonds, said heterocycle  
 group optionally comprising one or more aromatic  
 rings, and said cyclic group optionally being singly  
 10 or multiply substituted by -NH<sub>2</sub>, -CO<sub>2</sub>H,  
 -Cl, -F, -Br, -I, -NO<sub>2</sub>, -CN, =O, -OH,  
 -perfluoro C<sub>1-3</sub> alkyl, , or -Q<sub>1</sub>; and  
 15

each Ar<sub>2</sub> is independently selected from the  
 following group, in which any ring may optionally be  
 singly or multiply substituted by -Q<sub>1</sub> and -Q<sub>2</sub>:

each Q<sub>1</sub> is independently selected from the group  
 consisting of:

30 -Ar<sub>1</sub>  
 -O-Ar<sub>1</sub>  
 -R<sub>9</sub>,

- 361 -

-T<sub>1</sub>-R<sub>9</sub>, and  
 -(CH<sub>2</sub>)<sub>1,2,3</sub>-T<sub>1</sub>-R<sub>9</sub>;

each Q<sub>2</sub> is independently selected from the group  
 5 consisting of -OH, -NH<sub>2</sub>, -CO<sub>2</sub>H, -Cl, -F, -Br, -I,  
 -NO<sub>2</sub>, -CN, -CF<sub>3</sub>, and

10

provided that when -Ar<sub>1</sub> is substituted with a Q<sub>1</sub>  
 group which comprises one or more additional -Ar<sub>1</sub>  
 groups, said additional -Ar<sub>1</sub> groups are not  
 15 substituted with Q<sub>1</sub>.

120. The compound according to claim 119,  
 selected from the group consisting of:

- 362 -

5

10

121. The compound according to claim 119,  
wherein each A is independently selected from the  
group consisting of the  $\alpha$ -amino acids:

15

alanine,  
histidine,

- 363 -

lysine,  
 phenylalanine,  
 proline,  
 tyrosine,  
 5 valine,  
 leucine,  
 isoleucine,  
 glutamine,  
 methionine,  
 10 homoproline,  
 3-(2-thienyl) alanine, and  
 3-(3-thienyl) alanine.

122. A compound represented by the formula:

$R_1$  is  $R_5-(A)_p$ ;

$R_5$  is selected from the group consisting of:

-H,  
 -Ar<sub>1</sub>,  
 20 -CO-Ar<sub>1</sub>,  
 -SO<sub>2</sub>-Ar<sub>1</sub>,  
 -R<sub>9</sub>,  
 -CO-R<sub>9</sub>,  
 -CO-O-R<sub>9</sub>,  
 25 -SO<sub>2</sub>-R<sub>9</sub>,  
 /Ar<sub>1</sub>  
 -CO-N  
 \R<sub>10</sub>,

- 364 -

10 each A is independently selected from the group consisting of any  $\alpha$ -amino acid;

p is 0, 1, 2, 3 or 4;

15 each R<sub>9</sub> is a C<sub>1-6</sub> straight or branched alkyl group optionally singly or multiply substituted by -OH, -F, or =O and optionally substituted with one Ar<sub>1</sub> group;

each R<sub>10</sub> is independently selected from the group consisting of -H or a C<sub>1-6</sub> straight or branched alkyl group;

20 each T<sub>1</sub> is independently selected from the group consisting of:

-CH=CH-,  
-O-,  
-S-,  
-SO-,

25 each Ar<sub>1</sub> is a cyclic group independently selected from the set consisting of an aryl group which contains 6, 10, 12, or 14 carbon atoms and between 1 and 3 rings, a cycloalkyl group which contains between 3 and 15 carbon atoms and between 1 and 3

- 365 -

rings, said cycloalkyl group being opti nally  
 benzofused, and a heterocycle group containing  
 between 5 and 15 ring atoms and between 1 and 3  
 rings, said heterocycle group containing at least one  
 5 heteroatom group selected from -O-, -S-, -SO-, -SO<sub>2</sub>-,  
 =N-, and -NH-, said heterocycle group optionally  
 containing one or more double bonds, said heterocycle  
 group optionally comprising one or more aromatic  
 rings, and said cyclic group optionally being singly  
 10 or multiply substituted by -NH<sub>2</sub>, -CO<sub>2</sub>H,  
 -Cl, -F, -Br, -I, -NO<sub>2</sub>, -CN, =O, -OH,  
 -perfluoro C<sub>1-3</sub> alkyl,  CH<sub>2</sub>, or -Q<sub>1</sub>; and  
 15

each Ar<sub>2</sub> is independently selected from the  
 following group, in which any ring may optionally be  
 singly or multiply substituted by -Q<sub>1</sub> and -Q<sub>2</sub>:

20 (ii)

;

(jj)

; and

25 (kk)

;

each Q<sub>1</sub> is independently selected from the group  
 consisting of:

30 -Ar<sub>1</sub>  
 -O-Ar<sub>1</sub>  
 -R<sub>9</sub>,  
 -T<sub>1</sub>-R<sub>9</sub>,

and

- 366 -

-(CH<sub>2</sub>)<sub>1,2,3</sub>-T<sub>1</sub>-R<sub>9</sub>;

each Q<sub>2</sub> is independently selected from the group consisting of -OH, -NH<sub>2</sub>, -CO<sub>2</sub>H, -Cl, -F, -Br, -I,

5 -NO<sub>2</sub>, -CN, -CF<sub>3</sub>, and

10 provided that when -Ar<sub>1</sub> is substituted with a Q<sub>1</sub> group which comprises one or more additional -Ar<sub>1</sub> groups, said additional -Ar<sub>1</sub> groups are not substituted with Q<sub>1</sub>;

15 each X is independently selected from the group consisting of =N-, and =CH-; and

each Y is independently selected from the group consisting of -O-, -S-, and -NH.

123. The compound according to claim 122, selected from the group consisting of:

- 367 -

5

10

15

20

- 368 -

; and

124. The compound according to claim 122,  
 5 wherein each A is independently selected from the  
 group consisting of the  $\alpha$ -amino acids:
- alanine,
  - histidine,
  - lysine,
  - 10 phenylalanine,
  - proline,
  - tyrosine,
  - valine,
  - leucine,
  - 15 isoleucine,
  - glutamine,
  - methionine,
  - homoproline,
  - 3-(2-thienyl) alanine, and
  - 20 3-(3-thienyl) alanine.

# INTERNATIONAL SEARCH REPORT

1. International application No.

PCT/US 95/07617

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
**Please see annex!**
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.

**FURTHER INFORMATION CONTINUED FROM PCT/ISA/210**

**Claims searched completely: 102-109, 111-113, 115-118, 120-124**

**Claims searched incompletely: 1-101, 110, 114, 119**

In view of the large number of compounds falling under claims 1-101, 110, 114, 119, and of the absence of any sensible support for these claims in the description, the Search Division considers that it is not economically reasonable to draw a search report covering the entire subject matter of claims 1-101, 110, 114, 119. The search for the claims 1-101, 110, 114, 119 has therefore been limited and includes all the real examples given in the description and covers all similar compounds having the alleged activities as well (see also remark)

Remark: As far as the claim 76 is directed to a method of treatment of the human and/or animal body, the search has been carried out on the alleged effects of the compound and/or composition.
